

Combustion Reactions

A combustion reaction involves the reaction of a substance with oxygen to produce heat and/or light. Combustion reactions are a type of simple oxidation reaction.

A **hydrocarbon** is a substance that contains carbon and hydrogen. Methane (CH_4) and octane (C_8H_{18}) are examples of hydrocarbons. When a hydrocarbon undergoes combustion, carbon dioxide and water are produced.

Other organic compounds (carbon, hydrogen with other elements) also undergo combustion.

Complete Combustion of Hydrocarbons:

- occurs if enough oxygen is present

Incomplete Combustion of Hydrocarbons:

- occurs if *less* than enough oxygen is present

Some or all of these may be present.
Amounts may vary.

E.g. Incomplete Combustion of Propane

A comparative study of elite English-medium schools, public schools, and Islamic madaris in contemporary Pakistan Akhtar Hassan Malik,2015-04-12 This ethnographic study examines the role of differing school knowledge in reproducing various social classes in the society It was observed that an unequal availability of capital resources agents class habitus and the type of their cultural currency act as selection mechanisms that clearly favour some social groups over others The ruling classes ensure the transfer of their power and privilege to their children by providing them with quality education in elite schools The disadvantaged classes are excluded from these unique institutions by both social and economic sanctions They have no other option than to educate their children either in public schools or Islamic madaris As a result inequitable educational opportunities consolidate the existing social class hierarchy
