

1. A potter is making cups and plates. It takes her 6 minutes to make a cup and 3 minutes to make a plate. Each cup used $\frac{3}{4}$ lbs of clay and each plate uses 1 lb of clay. She has 20 hours available for making the cups and plates and has 250 lbs of clay on hand. She makes a profit of \$2 on each cup and \$1.50 on each plate. How many cups and how many plates should she make in order to maximise her profit?

Define Variables:

- Let x represent the number of cups
- Let y represent the number of plates

Constraints:

- $6x + 3y \leq 1200$
- $0.75x + y \leq 250$
- $x \geq 0$
- $y \geq 0$

Linear Programming for Beginners Doris Lloyd Grosh,2010 This book fills a gap in the linear programming literature by explaining the steps that are illustrated but not always fully explained in every elementary operations book the steps that lead from the elementary and intuitive graphical method of solution to the more advanced simplex tableau method Most of the world even those technically trained can get along very well by seeing a few illustrations of simple linear programming problems solved graphically followed by instruction in the use of computer software for solving real world problems But there needs to be a coterie of initiates who understand the process well enough to explain it to others to know what the pitfalls ramifications and special cases are and to provide further developments I have used an informal narrative style with a number of worked out examples and detailed explanations to put the topic within reach
