Software Engineering at Google Titus Winters, Tom Manshreck, Hyrum Wright, 2020-02-28 Today software engineers need to know not only how to program effectively but also how to develop proper engineering practices to make their codebase sustainable and healthy. This book emphasizes this difference between programming and software engineering. How can software engineers manage a living codebase that evolves and responds to changing requirements and demands over the length of its life? Based on their experience at Google, software engineers Titus Winters and Hyrum Wright, along with technical writer Tom Manshreck, present a candid and insightful look at how some of the world's leading practitioners construct and maintain software. This book covers Google's unique engineering culture, processes, and tools, and how these aspects contribute to the effectiveness of an engineering organization. You'll explore three fundamental principles that software organizations should keep in mind when designing, writing, and maintaining code: How time affects the sustainability of software and how to make your code resilient over time; How scale affects the viability of software practices within an engineering organization; and What trade-offs a typical engineer needs to make when evaluating design and development decisions.

Individual Characteristics Significant to Salary Levels of Engineers and Scientists Richard P. Howell, Martin Gorfinkel, Dale Bent, 1966 Effective comparisons between salaries of one engineer/scientist population and those of another may be made in two ways using equations developed in this study The first compares the aggregate salary of a given population with the aggregate salary of the population used in developing the equations of this study The steps necessary to make such a comparison consist in 1 obtaining point of hire characteristics of the population to be compared 2 entering the values of the variables called for in the equation developed in this study 3 computing the sum of the salaries and 4 comparing results with the sum of the actual salaries being paid The second type of comparison consists in developing a regression equation concerning the population to be compared using point of hire variables identical with those used in this study The coefficients or parameters of the resulting equations may then be compared to those of the equations developed here to provide insights concerning the relative emphasis placed by management knowingly or unknowingly on selected characteristics of new hires The coefficients or other parameters amount to a kind of profile and by knowingly controlling them a management may choose the characteristics that it wishes to stress in salary determinations Thus the salary structure may become a more effective means to implement policy
