man man man machine and machine machine interactions will increase and communication will have an important role in modern systems. In order to obtain effective and efficient communication, artistic, social, and technical issues have to be tackled in a holistic and integrated manner. However, communication techniques, concepts, and solutions which have been developed so far treat these issues separately so that there arises a need for communication researchers and practitioners in different fields: engineering, science, and arts to meet, share their experience, and explore all possibilities of developing integrated and advanced solutions which incorporate ideas from such disciplines as communication arts, art design, linguistics, Web technologies, computer system architecture and protocols, computer science, and artificial intelligence. INTELLCOMM 2004 was jointly sponsored by IFIP WG 6.7 Smart Networks and WG 6.4 Internet Applications Engineering and aimed to provide an international forum which brings academia, researchers, practitioners, and service providers together. The discussion areas covered the latest research topics and advanced technological solutions in the area of intelligence in communication systems ranging from architectures for adaptable networks, services, and Semantic Web.

Web service technologies to intelligent service application interface and intelligent human interaction. INTELLCOMM 2004 received 112 paper submissions from 28 countries. From these 24 were accepted and are included in this proceedings. There were also 3 papers accepted for poster presentation published separately. DISTRIBUTED OPERATING SYSTEMS SINHA, PRADEEP K., 1998-01-01. The highly praised book in communications networking from IEEE Press now available in the Eastern Economy Edition. This is a non-mathematical introduction to Distributed Operating Systems explaining the fundamental concepts and design principles of this emerging technology. As a textbook for students and as a self-study text for systems managers and software engineers, this book provides a concise and an informal introduction to the subject.

Engineering Human Computer Interaction and Interactive Systems Rémi Bastide, Philippe Palanque, Jörg Roth, 2005-07-04. As its name suggests, the EHCI/DSVIS conference has been a special event merging two different although overlapping research communities. EHCI (Engineering for Human Computer Interaction) is a conference organized by the IFIP 2.7.13.4 working group started in 1974 and held every three years since 1989. The group's activity is the scientific investigation of the relationships among the human factors in computing and software engineering. DSVIS (Design Specification and Verification of Interactive Systems) is an annual conference started in 1994 and dedicated to the use of formal methods for the design of interactive systems. Of course, these two research domains have a lot in common and are informed by each other's results. The year 2004 was a good opportunity to bring closer these two research communities for an event: the 11th edition of DSVIS and the 9th edition of EHCI. EHCI/DSVIS was set up as a working conference bringing together researchers and practitioners interested in strengthening the scientific foundations of user interface design, specification, and verification and in examining the relationships between software engineering and human computer interaction. The call for papers attracted a lot of attention and we received a record number of submissions: out of the 65 submissions, 23 full papers were accepted, which

gives an acceptance rate of approximately 34% Three short papers were also included The contributions were categorized in 8 chapters Chapter 1 Usability and Software Architecture contains three contributions which advance the state of the art in usability approaches for modern software engineering

**Cooperating Embedded Systems and Wireless Sensor Networks** Michel Banatre, Pedro Jose Marron, Anibal Ollero, Adam Wolisz, 2010-01-05 A number of different system concepts have become apparent in the broader context of embedded systems over the past few years Whilst there are some differences between these this book argues that in fact there is much they share in common particularly the important notions of control heterogeneity wireless communication dynamics ad hoc nature and cost The first part of the book covers cooperating object applications and the currently available application scenarios such as control and automation healthcare and security and surveillance The second part discusses paradigms for algorithms and interactions The third part covers various types of vertical system functions including data aggregation resource management and time synchronization The fourth part outlines system architecture and programming models outlining all currently available architectural models and middleware approaches that can be used to abstract the complexity of cooperating object technology Finally the book concludes with a discussion of the trends guiding current research and gives suggestions as to possible future developments and how various shortcomings in the technology can be overcome
