*Factory Physics* Wallace J. Hopp, Mark L. Spearman, 2011-08-31 Our economy and future way of life depend on how well American manufacturing managers adapt to the dynamic globally competitive landscape and evolve their firms to keep pace. A major challenge is how to structure the firm's environment so that it attains the speed and low cost of high volume flow lines while retaining the flexibility and customization potential of a low volume job shop. The book's three parts are organized according to three categories of skills required by managers and engineers: basics, intuition, and synthesis. Part I reviews traditional operations management techniques and identifies the necessary components of the science of manufacturing. Part II presents the core concepts of the book, beginning with the structure of the science of manufacturing and a discussion of the systems approach to problem solving. Other topics include behavioral tendencies of manufacturing plants, push and pull production systems, the human element in operations management, and the relationship between quality and operations. Chapter conclusions include main points and observations framed as manufacturing laws. In Part III, the lessons of Part I and the laws of Part II are applied to address specific manufacturing management issues in detail. The authors compare and contrast common problems including shop floor control, long range aggregate planning, workforce planning, and capacity management. A main focus in Part III is to help readers visualize how general concepts in Part II can be applied to specific problems. Written for both engineering and management students, the authors demonstrate the effectiveness of a rule-based and data-driven approach to operations planning and control. They advance an organized framework from which to evaluate management practices and develop useful intuition about manufacturing systems.

**Efficient Processing of Deep Neural Networks** Vivienne Sze, Yu-Hsin Chen, Tien-Ju Yang, Joel S. Emer, 2022-05-31 This book provides a structured treatment of the key principles and techniques for enabling efficient processing of deep neural networks (DNNs). DNNs are currently widely used for many artificial intelligence (AI) applications, including computer vision, speech recognition, and robotics. While DNNs deliver state-of-the-art accuracy on many AI tasks, it comes at the cost of high computational complexity. Therefore, techniques that enable efficient processing of deep neural networks to improve key metrics such as energy efficiency, throughput, and latency without sacrificing accuracy or increasing hardware costs are critical to enabling the wide deployment of DNNs in AI systems. The book includes background on DNN processing, a description and taxonomy of hardware architectural approaches for designing DNN accelerators, key metrics for evaluating and comparing different designs, features of DNN processing that are amenable to hardware algorithm co-design to improve energy efficiency and throughput, and opportunities for applying new technologies. Readers will find a structured introduction to the field, as well as formalization and organization of key concepts from contemporary work that provide insights that may spark new ideas.

**Optimization Concepts and Applications in Engineering** Ashok D. Belegundu, Tirupathi R. Chandrupatla, 2011-03-28 In this revised and enhanced second edition of *Optimization Concepts and Applications in Engineering*, the already robust pedagogy has been enhanced with more detailed explanations, an increased number of solved examples, and end-of-chapter problems. The source codes are now available free on multiple platforms. It is vitally important to meet or exceed previous quality and reliability standards while at the same time reducing resource consumption. This textbook addresses this critical imperative by integrating theory, modeling, the development of numerical methods, and problem solving, thus preparing the student to apply optimization to real-world problems. This text covers a broad variety of optimization problems using unconstrained, constrained, gradient, and non-gradient techniques, duality concepts, multiobjective optimization, linear integer, geometric, and dynamic programming with applications, and finite element based optimization. It is ideal for advanced undergraduate or graduate courses and for practicing engineers in all engineering disciplines as well as in applied mathematics.
