The search for knowledge on cellular and molecular mechanisms involved in skeletal muscle mass homeostasis and regeneration is an exciting scientific area and extremely important to develop therapeutic strategies for neuromuscular disorders and conditions related to muscle wasting. The mechanisms involved in the regulation of skeletal muscle mass and regeneration consist of molecular signaling pathways modulating protein synthesis and degradation, bioenergetics alterations and preserved function of muscle stem cells. In the last years, different kinds of stem cells has been reported to be localized into skeletal muscle (satellite cells, mesoangioblasts, progenitor interstitial cells and others) or migrate from non-muscle sites, such as bone marrow, to muscle tissue in response to injury. In addition, myogenic progenitor cells are also activated in skeletal muscle wasting disorders. The goal of this research topic is to highlight the available knowledge regarding skeletal muscle and stem cell biology in the context of both physiological and pathological conditions. Our purpose herein is to facilitate better dissemination of research into skeletal muscle physiology field. *Frontiers in Physiology* is a journal indexed in: PubMed Central, Scopus, Google Scholar, DOAJ, CrossRef. This information is conveyed through a comprehensive treatment of the overarching principles and theories that are behind mechanobiological processes, aortic and arterial mechanics, atherosclerosis, blood and microcirculation, hear valve mechanics, as well as medical devices and drugs. Examines all major theoretical and practical aspects of mechanical forces related to the cardiovascular system. Discusses a unique coverage of mechanical changes related to an aging cardiovascular system. Provides an overview of experimental methods in cardiovascular mechanics. Written by world-class researchers from Canada, the US and EU. Extensive references are provided at the end of each chapter to enhance further study. Michel R. Labrosse is the founder of the Cardiovascular Mechanics Laboratory at the University of Ottawa, where he is a full professor within the Department of Mechanical Engineering. He has been an active researcher in academia along with being heavily associated with the University of Ottawa Heart Institute. This is the shortened, English-language version of the German volume published in 1989 and omits those contributions and passages that refer only to German laws, or which have little relevance outside Germany. It includes additional texts, especially on the relevant European norms and the canon of the Abwassertechnische Vereinigung [German Waste Water Technology Association] as well as the latest research and development reports. The result is a comprehensive overview of the technology currently available for wastewater management and systems plus the relevant norms, with special emphasis on maintenance, cleaning, inspection and reconstruction. A number of European systems are used to describe in detail pipe materials and connections, pipework-specific framework conditions and their changes since the development of modern drains and sewers in the 19th century. The book also lists causes and effects of

various types of damage, and their assessment in terms of hydraulics, environmental relevance and construction, since this is a basic prerequisite for the choice of suitable rehabilitation measures and their implementation. Readers are thus not only provided with a comprehensive presentation of all internationally practised rehabilitation processes and their fields of application, but are also given advice on their selection, on the formulation of tenders, cost and cost efficiency.
