Flood Warning, Forecasting and Emergency Response Mar 30 2021 Recent flood events in Europe, the USA and elsewhere have shown the devastating impact that flooding can have on people and property. Flood warning and forecasting systems provide a well-established way to help to reduce the effects of flooding by allowing people to be evacuated from areas at risk, and for measures to be taken to reduce damage to property. With sufficient warning, temporary defences (sandbags, flood gates etc) can also be installed, and river control structures operated to mitigate the effects of flooding. Many countries and local authorities now operate some form of flood warning system, and the underlying technology requires knowledge across a range of technical areas, including rainfall and tidal detection systems, river and coastal flood forecasting models, flood warning dissemination systems, and emergency response procedures. This book provides a comprehensive account of the flood forecasting, warning and emergency response process, including techniques for predicting the development of flood events, and for issuing appropriate warnings. Related topics, such as telemetry and information systems, and flood warning economics, are also discussed. For perhaps the first time, this book brings together in a single volume the many strands of this interesting multidisciplinary topic, and will serve as a reference for researchers, policy makers and engineers. The material on meteorological, hydrological and coastal modelling and monitoring may also be of interest to a wider audience.

Research Methods May 01 2021 "This research methods textbook distinguishes itself from other textbooks by providing a unique framework and perspective for users/students to establish the relevancy of research in their clinical practice. Many, if not most, students in professional preparation allied health care programs view the research methods/statistics course requirement of the curriculum as an obstacle to be overcome, or at best, as a necessary evil. Most research methods textbooks promote these notions because of the way they are presented. Of course, most times they are written by researchers or statisticians and are absolutely correct in presenting the theoretical underpinnings and mechanistic applications of the scientific method. They correctly present explanations as to why one type of methodology requires a certain type of statistical analysis based on the

characteristics of the study population, the type of data collected, or the underlying assumptions pertinent to a specific statistical model. So, while technically beyond reproach, their failure is in establishing how and why research activity and understanding is integral to a professional practice"--Provided by publisher.
