

7.4 Homeostasis and Cells

Lesson Objectives

-  Explain how unicellular organisms maintain homeostasis.
-  Explain how multicellular organisms maintain homeostasis.

Lesson Summary

The Cell as an Organism Sometimes a single cell is an organism. Single-celled organisms must be able to carry out all the functions necessary for life.

- ▶ Unicellular organisms maintain **homeostasis**, relatively constant internal conditions, by growing, responding to the environment, transforming energy, and reproducing.
- ▶ Unicellular organisms include both prokaryotes and eukaryotes.
- ▶ Unicellular organisms play many important roles in their environments.

Multicellular Life Cells of multicellular organisms are interdependent and specialized.

- ▶ The cells of multicellular organisms become specialized for particular tasks and communicate with one another to maintain homeostasis.
- ▶ Specialized cells in multicellular organisms are organized into groups.
 - A **tissue** is a group of similar cells that performs a particular function.
 - An **organ** is a group of tissues working together to perform an essential task.
 - An **organ system** is a group of organs that work together to perform a specific function.
- ▶ The cells of multicellular organisms communicate with one another by means of chemical signals that are passed from one cell to another.
 - Certain cells form connections, or **cellular junctions**, to neighboring cells. Some of these junctions hold cells together firmly.
 - Other cells allow small molecules carrying chemical signals to pass directly from one cell to the next.
 - To respond to a chemical signal, a cell must have a **receptor** to which the signaling molecule can bind.

The Cell as an Organism

For Questions 1–5, complete each statement by writing the correct word or words.

1. The term _____ refers to the relatively constant internal physical and chemical state of a living cell.
2. Unicellular prokaryotes, called _____, are adapted to living in a remarkable number of different places.
3. Some unicellular eukaryotes, called _____, contain chloroplasts.
4. Yeasts are unicellular _____, which are eukaryotes.
5. Other unicellular eukaryotes include _____ and algae.

Regulation of Tissue Oxygenation, Second Edition Roland N. Pittman, 2016-08-18 This presentation describes

various aspects of the regulation of tissue oxygenation including the roles of the circulatory system respiratory system and blood the carrier of oxygen within these components of the cardiorespiratory system The respiratory system takes oxygen from the atmosphere and transports it by diffusion from the air in the alveoli to the blood flowing through the pulmonary capillaries The cardiovascular system then moves the oxygenated blood from the heart to the microcirculation of the various organs by convection where oxygen is released from hemoglobin in the red blood cells and moves to the parenchymal cells of each tissue by diffusion Oxygen that has diffused into cells is then utilized in the mitochondria to produce adenosine triphosphate ATP the energy currency of all cells The mitochondria are able to produce ATP until the oxygen tension or PO₂ on the cell surface falls to a critical level of about 4 5 mm Hg Thus in order to meet the energetic needs of cells it is important to maintain a continuous supply of oxygen to the mitochondria at or above the critical PO₂ In order to accomplish this desired outcome the cardiorespiratory system including the blood must be capable of regulation to ensure survival of all tissues under a wide range of circumstances The purpose of this presentation is to provide basic information about the operation and regulation of the cardiovascular and respiratory systems as well as the properties of the blood and parenchymal cells so that a fundamental understanding of the regulation of tissue oxygenation is achieved
