Predictions in the Brain Moshe Bar,2011-05-10 When one is immersed in the fascinating world of neuroscience findings the brain might start to seem like a collection of modules each specializes in a specific mental feat But just like in other domains of Nature it is possible that much of the brain and mind s operation can be explained with a small set of universal principles Given exciting recent developments in theory empirical findings and computational studies it seems that the generation of predictions might be one strong candidate for such a universal principle This is the focus of Predictions in the brain From the predictions required when a rat navigates a maze to food caching in scrub jays from predictions essential in decision making to social interactions from predictions in the retina to the prefrontal cortex and from predictions in early development to foresight in non humans The perspectives represented in this collection span a spectrum from the cellular underpinnings to the computational principles underlying future related mental processes and from systems neuroscience to cognition and emotion In spite of this diversity they share some core elements Memory for instance is critical in any framework that explains predictions In asking what is next our brains have to refer to memory and experience on the way to simulating our mental future But as much as this collection offers answers to important questions it raises and emphasizes outstanding ones How are experiences coded optimally to afford using them for predictions How do we construct a new simulation from separate memories How specific in detail are future oriented thoughts and when do they rely on imagery concepts or language Therefore in addition to presenting the state of the art of research and ideas about predictions as a universal principle in mind and brain it is hoped that this collection will stimulate important new research into the foundations of our mental lives
