

Chapter 26 Exploring the Universe

Summary

26.1 The Sun

- ⊖ The sun's energy is produced in its central region by the fusion of hydrogen nuclei into helium nuclei.
- ⊖ The sun remains stable because the inward pull of gravity balances the outward push of thermal pressure from nuclear fusion.
- ⊖ The sun's interior consists of the core, the radiation zone, and the convection zone.
 - The sun's **core** is its central region, where nuclear fusion occurs.
 - The **radiation zone** is the middle layer of the sun's interior. It is a region of gas under pressure.
 - The **convection zone** is the outer layer of the sun's interior.
- ⊖ The sun's atmosphere consists of three layers: the photosphere, the chromosphere, and the corona.
 - The **photosphere** is the innermost layer of the sun's atmosphere. It is the visible surface of the sun.
 - The **chromosphere** is the middle layer of the sun's atmosphere. It is hotter than the photosphere.
 - The **corona** is the outermost layer of the sun's atmosphere. The gases here are very thin. It gradually thins into the solar wind.
 - The **solar wind** is a stream of electrically charged particles. The stream flows outward from the sun through the solar system.
- ⊖ Features of the sun's atmosphere include sunspots, prominences, and solar flares.
 - **Sunspots** are relatively cool areas in the photosphere. They look like dark spots on the sun's surface.
 - **Prominences** are huge loops of gas that erupt from sunspot regions.
 - **Solar flares** are sudden bursts of energy released from the sun.

26.2 Stars

- A **star** is large, glowing ball of gas in space. It produces energy through nuclear fusion in its core.
- A **light-year** is the distance that light travels in a vacuum in a year, which is about 9.5 trillion kilometers.
