

Chapter 18: Molecular Biology of the Cell

1. What does nucleoside/nucleotide synthesis that requires only the genes of one prokaryotic species?
 - Biosynthetic pathway that use common precursors and enzymes from a relatively advantage over cells that are unable to do so.
2. What is the key advantage of grouping genes of related function in a single transcription unit?
 - This key advantage is that genes are coordinately controlled because a single on-off switch can control a cluster of functionally related genes.
3. What are an operator and promoter?
 - An operator is a DNA sequence where a repressor is produced and the promoter is where RNA polymerase binds.
4. What does the operator control?
 - It controls the access of RNA polymerase to the genes.
5. What is the name of the protein produced and the genes they control?
 - Repressor
6. What can happen if the repressor is bound to O?
 - This RNA polymerase can't bind to the promoter and transcribe the genes of the operon.
7. How does a repressor work?
 - This repressor protein works by binding to the gene's promoter region, preventing the polymerase from binding there.
8. What are the two states that the operator exhibits (positive feedback)?
 - One allows the repressor to bind and stop the repressor being made.
9. How can the repressor protein be affected?
 - It can be made in a repressed state or high temperature changes, and other and chemical changes.
10. What are the two methods of regulated gene expression?
 - Repressible and inducible systems.
11. What is the repressor called when repressed?
 - It is repressor that would allow regulated by a repressor.
