Neural Control of Renal Function Ulla

Kopp,2011 The kidney is innervated with efferent sympathetic nerve fibers reaching the renal vasculature the tubules the juxtaglomerular granular cells and the renal pelvic wall The renal sensory nerves are mainly found in the renal pelvic wall Increases in efferent renal sympathetic nerve activity reduce renal blood flow and urinary sodium excretion by activation of α_1 adrenoceptors and increase renin secretion rate by activation of β_1 adrenoceptors In response to normal physiological stimulation changes in efferent renal sympathetic nerve activity contribute importantly to homeostatic regulation of sodium and water balance The renal mechanosensory nerves are activated by stretch of the renal pelvic tissue produced by increases in renal pelvic tissue of a magnitude that may occur during increased urine flow rate Activation of the sensory nerves elicits an inhibitory renorenal reflex response consisting of decreases in efferent renal sympathetic nerve activity leading to natriuresis Increasing efferent sympathetic nerve activity increases afferent renal nerve activity which in turn decreases efferent renal sympathetic nerve activity by activation of the renorenal reflexes Thus activation of the afferent renal nerves buffers changes in efferent renal sympathetic nerve activity in the overall goal of maintaining sodium balance In pathological conditions of sodium retention impairment of the inhibitory renorenal reflexes contributes to an inappropriately increased efferent renal sympathetic nerve activity in the presence of sodium retention In states of renal disease or injury there is a shift from inhibitory to excitatory reflexes originating in the kidney Studies in essential hypertensive patients have shown that renal denervation results in long term reduction in arterial pressure suggesting an important role for the efferent and afferent renal nerves in hypertension

Forster, Philip Lister, 2016-05-30 Microbiology covers the scope and sequence requirements for a single semester microbiology course for non majors The book presents the core concepts of microbiology with a focus on applications for careers in allied health The pedagogical features of the text make the material interesting and accessible while maintaining the career application focus and scientific rigor inherent in the subject matter Microbiology's art program enhances students understanding of concepts through clear and effective illustrations diagrams and photographs Microbiology is produced through a collaborative publishing agreement between OpenStax and the American Society for Microbiology Press The book aligns with the curriculum guidelines of the American Society for Microbiology BC Campus website *The Vascular Pole of the Renal Glomerulus of Rat* Marlies Elger, Tatsuo Sakai, Wilhelm Kriz, 1997-10-10 Knowledge of the architecture of the renal glomerulus is a prerequisite for understanding both glomerular function and pathology Glomerular filtration depends on comparably high intracapillary hydrostatic pressures These high pressures must be balanced by commensurate counterforces to maintain structural integrity Elevated pressures can damage the glomerulus The window for pressures high enough for effective filtration and yet tolerable to the glomerulus is narrow Precise regulation is therefore necessary to keep intraglomerular pressure within an appropriate range This study provides a comprehensive description of the glomerular arterioles which are the vessels primarily responsible for the regulation of intraglomerular pressures It thereby describes the structures which may be presumed to generate counterforces needed to assure structural stability The arterioles are closely associated with the supporting system comprised of the intra and extraglomerular mesangium The extraglomerular mesangium forms a spider like clamp providing a mechanical interconnection of all components of the vascular pole At the same time it may act as a tension receptor i e as a sensor of intraglomerular pressures Due to its intimate relationship to the macula densa the extraglomerular mesangium receives information on the distal solute delivery and therefore may act as the integrative center within the juxtaglomerular apparatus The close spatial association between the afferent and efferent arterioles at the vascular pole suggests a direct regulatory interaction between both arterioles In addition the specific wall structure of the efferent arteriole exhibiting the

features of a shear stress receptor suggests new pathways for feedback regulation of glomerular hemodynamics **The Digestive and Urinary Systems** Joseph Midthun, 2016-06-01 This graphic nonfiction book introduces the digestive and urinary systems of the human body The Building Blocks of Life Science volumes feature whimsical characters to guide young readers through topics exploring the human body systems Full page or full spread diagrams detail the different parts of each body system The science is as sound as the presentation is fun The volumes include a glossary an additional resource list and an index Several spreads in each volume are illustrated with photographs to help clarify concepts and facts Campbell Walsh Wein Urology Alan W.
