In one handy resource, the editors have collected the best-thinking on energy finance. This book integrates the models employed in the fundamental analysis of a company with the models used by investors in the capital markets to diversify risks and maximize expected returns. The underlying thesis is that the company creates value only if the return on capital invested exceeds the cost of capital, while the objective is to demonstrate how integration of the fields of corporate finance and asset pricing enables comprehensive and accurate company valuation. Companies can thrive only if they are able to create value for shareholders over time. A company's value creation and the correct approach to its measurement require two main skills: first, the ability to analyze and evaluate the company's fundamentals with respect to its business model and its performance over time; and second, knowledge of investors' models with regard to risk diversification and return maximization from which the cost of capital for the firm is derived. Based on this perspective, the book combines rigorous quantitative analysis with effective use of graphics to aid intuitive understanding. This text thoroughly discusses a series of techniques in financial statement analysis, such as business strategy analysis, accounting analysis, financial analysis (ratio and cash flow analysis), and prospective analysis for forecasting and valuation. To that end, the book includes eVal, an Excel-based software application that guides the user through the forecasting and valuation processes while taking care of the minute details of valuation computations. By providing a unified interface for the valuation process, eVal allows you to focus on the forecasting, not on the spreadsheet. eVal also includes financial data for over 8,000 companies along with links to company websites, SEC filings, forecasts and other great sources of data to improve the user's forecasts.
