Print+CourseSmart Originally published in 1983, Leo Steinberg's classic work has changed the viewing habits of a generation. After centuries of repression and censorship, the sexual component in thousands of revered icons of Christ is restored to visibility. Steinberg's evidence resides in the imagery of the overtly sexed Christ, in Infancy and again after death. Steinberg

argues that the artists regarded the deliberate exposure of Christ's genitalia as an affirmation of kinship with the human condition. Christ's lifelong virginity, understood as potency under check, and the first offer of blood in the circumcision, both required acknowledgment of the genital organ. More than exercises in realism, these unabashed images underscore the crucial theological import of the Incarnation. This revised and greatly expanded edition not only adduces new visual evidence, but deepens the theological argument and engages the controversy aroused by the book's first publication. Designed to

The secretions of the exocrine pancreas provide for digestion of a meal into components that are then available for processing and

absorption by the intestinal epithelium. Without the exocrine pancreas, malabsorption and malnutrition result. This chapter describes the cellular participants responsible for the secretion of digestive enzymes and fluid that in combination provide a pancreatic secretion that accomplishes the digestive functions of the gland. Key cellular participants, the acinar cell and the duct cell, are responsible for digestive enzyme and fluid secretion, respectively, of the exocrine pancreas. This chapter describes the neurohumoral pathways that mediate the pancreatic response to a meal as well as details of the cellular

mechanisms that are necessary for the organ responses, including protein synthesis and transport and ion transports, and the regulation of these responses by intracellular signaling systems. Examples of pancreatic diseases resulting from dysfunction in cellular mechanisms provide emphasis of the importance of the normal physiologic mechanisms. "JOHN MUIR, Earth-planet, Universe."—These words are written on the inside cover of the notebook from which the contents of this volume have been taken. They reflect the mood in which the late author and explorer undertook his thousand-mile walk to the Gulf

of Mexico. No less does this refreshingly cosmopolitan address, which might have startled any finder of the book, reveal the temper and the comprehensiveness of Mr. Muir's mind. He never was and never could be a parochial student of nature. In September 1867, Muir undertook a walk of about 1,000 miles (1,600 km) from Kentucky to Florida, which he recounted in his book *A Thousand-Mile Walk to the Gulf*. He had no specific route chosen, except to go by the "wildest, leafiest, and least trodden way I could find." Designed to support the trusted content in Kinn's *The Administrative Medical*

Reading has arguably the longest and richest history of any domain for scientifically considering the impact of technology on the

user. From the 1920s to the 1950s, Miles Tinker [1963] and other researchers ran hundreds of user tests that examined the effects of different fonts and text layout variables, such as the amount of vertical space between each line of text (called leading). Their research focused on user performance, and reading speed was the favoured measure. They charted the effect of the manipulated variables on reading speed, looking for the point at which their participants could read the fastest. Their assumption was that faster reading speeds created a more optimal experience. Printers and publishers eagerly consumed

this research. In recent years, some of these variables have been reexamined as the technology and capabilities evolve with the advent of computers and computer screens. Dillon [1992] examined how to design textual information for an electronic environment. Boyarski et al. [1998] examined the effect of fonts that were designed for computer screens. Dyson & Kipping [1998] examined the effect of line length on computer screens. Larson et al. [2000] examined the effect of 3-D rotation on reading. Gugerty et al. [2004] demonstrated a reading performance advantage with the Microsoft ClearType

display technology. Entering its 6th edition, *Physician Assistant: A Guide to Clinical Practice* is the only text that covers all aspects of the physician assistant profession, the PA curriculum, and the PA's role in clinical practice. This book combines work from curators, digital artists, human

computer interaction researchers and computer scientists to examine the mutual benefits and challenges posed when working together to support digital art works in their many forms. In *Curating the Digital* we explore how we can work together to make space for art and interaction. We look at the various challenges such as the dynamic nature of our media, the problems posed in preserving digital art works and the thorny problems of how we assess and measure audience's reactions to interactive digital work. *Curating the Digital* is an outcome of a multi-disciplinary workshop that took place at SICH2014 in Toronto. The

participants from the workshop reflected on the theme of *Curating the Digital* via a series of presentations and rapid prototyping exercises to develop a catalogue for the future digital art gallery. The results produce a variety of insights both around the theory and philosophy of curating digital works, and also around the practical and technical possibilities and challenges. We present these complimentary chapters so that other researchers and practitioners in related fields will find motivation and imagination for their own work. Insightful and whimsical, profoundly intelligent and easily accessible, Don Norman has been exploring the design of

our world for decades, exploring this complex relationship between humans and machines. In this seminal work, fully revised and updated, Norman gives us the first steps towards demanding a person-centered redesign of the machines we use every day. Humans have always worked with objects to extend our cognitive powers, from counting on our fingers to designing massive supercomputers. But advanced technology does more than merely assist with memory—the machines we create begin to shape how we think and, at times, even what we value. In *THINGS THAT MAKE US SMART*, Donald

Norman explores the complex interaction between human thought and the technology it creates, arguing for the development of machines that fit our minds, rather than minds that must conform to the machine.
