Bioprocess Engineering Principles Pauline M. Doran,1995-04-03 The emergence and refinement of techniques in molecular biology has changed our perceptions of medicine agriculture and environmental management Scientific breakthroughs in gene expression protein engineering and cell fusion are being translated by a strengthening biotechnology industry into revolutionary new products and services Many a student has been enticed by the promise of biotechnology and the excitement of being near the cutting edge of scientific advancement However graduates trained in molecular biology and cell manipulation soon realise that these techniques are only part of the picture Reaping the full benefits of biotechnology requires manufacturing capability involving the large scale processing of biological material Increasingly biotechnologists are being employed by companies to work in co operation with chemical engineers to achieve pragmatic commercial goals For many years aspects of biochemistry and molecular genetics have been included in chemical engineering curricula yet there has been little attempt until recently to teach aspects of engineering applicable to process design to biotechnologists This textbook is the first to present the principles of bioprocess engineering in a way that is accessible to biological scientists Other texts on bioprocess engineering currently available assume that the reader already has engineering training On the other hand chemical engineering textbooks do not consider examples from bioprocessing and are written almost exclusively with the petroleum and chemical industries in mind This publication explains process analysis from an engineering point of view but refers exclusively to the treatment of biological systems Over 170 problems and worked examples encompass a wide range of applications including recombinant cells plant and animal cell cultures immobilised catalysts as well as traditional fermentation systems First book to present the principles of bioprocess engineering in a way that is accessible to biological scientists Explains process analysis from an engineering point of view but uses worked examples relating to biological systems Comprehensive single

authored 170 problems and worked examples encompass a wide range of applications involving recombinant plant and animal cell cultures immobilized catalysts and traditional fermentation systems 13 chapters organized according to engineering sub disciplines are grouped in four sections Introduction Material and Energy Balances Physical Processes and Reactions and Reactors Each chapter includes a set of problems and exercises for the student key references and a list of suggestions for further reading Includes useful appendices detailing conversion factors physical and chemical property data steam tables mathematical rules and a list of symbols used Suitable for course adoption follows closely curricula used on most bioprocessing and process biotechnology courses at senior undergraduate and graduate levels

Life Cycle Costing John W. Bull,2015 The key areas of life cycle cost analysis LCCA and whole life costing WLC are exemplified in this volume with accounts of their application to housing stock a community hydroelectric power system various aspects of highway infrastructure and corrosion protective coatings Sustainable construction and design requires more than compliance with safety requirements and economic constraints there is also the impact on the environment the surrounding population and users of the infrastructure This requires a multidimensional perspective of sustainability to be considered in life cycle costing LCC combining current design criteria with these other aspects It has become increasingly important to understand the full costs of civil engineering infrastructure and the main sources of cost along the whole supply chain and to identify cost reduction opportunities The conventional procurement approach without the integration of probabilistic life cycle cost modelling induces substantial long term maintenance costs Once deterioration and life cycle cost models have been established appropriate partnership procurement strategies associated financing methods and determination of the project period can be developed LCC includes the cost of

planning design acquisition operation maintenance and disposal of buildings and other construction assets while WLC additionally includes incomes and other costs such as non construction costs and externalities In whole life costing social environmental or business costs or benefits are considered as externalities and care must be taken not to double count the impacts when WLC is used together with LCCA The international examples included in this book illustrate practically the methodology of life cycle costing and the application of life cycle cost analysis to identify the most appropriate method for assessing the relative merits of competing project implementation alternatives
