Principal Component Analysis I.T. Jolliffe, 2013-03-09 Principal component analysis is probably the oldest and best known of the It was first introduced by Pearson 1901 techniques of multivariate analysis and developed independently by Hotelling 1933 Like many multivariate methods it was not widely used until the advent of electronic computers but it is now well entrenched in virtually every statistical computer package The central idea of principal component analysis is to reduce the dimensionality of a data set in which there are a large number of interrelated variables while retaining as much as possible of the variation present in the data set This reduction is achieved by transforming to a new set of variables the principal components which are uncorrelated and which are ordered so that the first few retain most of the variation present in all of the original variables Computation of the principal components reduces to the solution of an eigenvalue eigenvector problem for a positive semidefinite symmetric matrix Thus the definition and computation of principal components are straightforward but as will be seen this apparently simple technique has a wide variety of different applications as well as a number of different derivations Any feelings that principal component analysis is a narrow subject should soon be dispelled by the present book indeed some quite broad topics which are related to principal component analysis receive no more than a brief mention in the final two chapters
