Signal Processing and Linear Systems B. P. Lathi, R. A. Green, 2021-02 This text presents a comprehensive treatment of signal processing and linear systems suitable for undergraduate students in electrical engineering It is based on Lathi's widely used book *Linear Systems and Signals* with additional applications to communications controls and filtering as well as new chapters on analog and digital filters and digital signal processing This volume's organization is different from the earlier book Here the Laplace transform follows Fourier rather than the reverse continuous time and discrete time systems are treated sequentially rather than interwoven Additionally the text contains enough material in discrete time systems to be used not only for a traditional course in signals and systems but also for an introductory course in digital signal processing In *Signal Processing and Linear Systems* Lathi emphasizes the physical appreciation of concepts rather than the mere mathematical manipulation of symbols Avoiding the tendency to treat engineering as a branch of applied mathematics he uses mathematics not so much to prove an axiomatic theory as to enhance physical and intuitive understanding of concepts Wherever possible theoretical results are supported by carefully chosen examples and analogies allowing students to intuitively discover meaning for themselves

Linear System Theory and Design Chi-Tsong Chen, 1984 Uses simple and efficient methods to develop results and design procedures thus creating a non exhaustive approach to presenting the material Enables the reader to employ the results to carry out design Thus most results are discussed with an eye toward numerical computation All design procedures in the text can be carried out using any software package that includes singular value decomposition and the solution of linear algebraic equations and the Lyapunov equation All examples are developed for numerical computation and are illustrated using MATLAB the most widely available software package
