Chapter 38: Conservation Biology

Guided Reading Activities**Big idea: The loss of biodiversity**

Answer the following questions as you read modules 38.1–38.6:

- The three components of biodiversity include: ecosystem diversity, species diversity, and genetic diversity.
- Briefly contrast extirpation with extinction.
Extirpation refers to the loss of one population of a species, whereas extinction refers to the loss of all individuals of a species.
- Complete the following table, which compares the different kinds of diversity.

	Ecosystem	Species	Genetic
Description	The total of the world's natural ecosystems	The total of all of the world's different species	The total of all alleles for all genes within a population; this diversity is the pool from which microevolution draws when conditions change
Example	Mojave Desert	California condor	A gene that confers resistance to a pest found in a wild variety of an economically important crop plant

- True or false: The greatest threat to biodiversity is pollution from human activities. If false, make it a correct statement.
False, the single greatest threat is from habitat loss.
- Would a top-level predator be expected to have more or less of a pollutant in its body? Briefly explain your answer.
It would be expected to have more of a pollutant in its body as a result of biological magnification.
- Zebra mussels are a huge threat to native species of the Great Lakes. What type of threat is this?
This is a threat from invasive species.

Microscopy Jeremy Sanderson, 2019-05-06 Introduces readers to the enlightening world of the modern light microscope. There have been rapid advances in science and technology over the last decade and the light microscope together with the information that it gives about the image has changed too. Yet the fundamental principles of setting up and using a microscope rests upon unchanging physical principles that have been understood for years. This informative practical full colour guide fills the gap between specialised edited texts on detailed research topics and introductory books which concentrate on an optical approach to the light microscope. It also provides comprehensive coverage of confocal microscopy which has revolutionised light microscopy over the last few decades. Written to help the reader understand set up and use the often very expensive and complex modern research light microscope properly. Understanding Light Microscopy keeps mathematical formulae to a minimum containing and explaining them within boxes in the text. Chapters provide in depth coverage of basic microscope optics and design ergonomics illumination diffraction and image formation reflected light polarised light and fluorescence microscopy deconvolution TIRF microscopy FRAP super resolution techniques biological and materials specimen preparation and more. Gives a didactic introduction to the light microscope. Encourages readers to use advanced fluorescence and confocal microscopes within a research institute or core microscopy facility. Features full colour illustrations and workable practical protocols. Understanding Light Microscopy is intended for any scientist who wishes to understand and use a modern light microscope. It is also ideal as supporting material for a formal taught course or for individual students to learn the key aspects of light microscopy through their own study.
