The Eastern Mediterranean region is a classic area for the study of tectonic processes and settings related to the development of the Tethyan orogenic belt. The present set of research and synthesis papers by earth scientists from countries in this region and others provides an up-to-date, interdisciplinary overview of the tectonic development of the Eastern Mediterranean region from Precambrian to Recent. Key topics include continental rifting, ophiolite genesis and emplacement, continental collision, extensional tectonics, crustal exhumation and intra-plate

deformation (e.g. active faulting). Alternative tectonic reconstructions of the Tethyan orogen are presented and discussed, with important implications for other regions of the world. The book will be an essential source of information and interpretation for academic researchers (geologists and geophysicists), advanced undergraduates and also for industry professionals, including those concerned with hydrocarbons, minerals and geological hazards (e.g. earthquakes). A listing of medical practitioners registered with the General Medical Council. Includes England, Scotland, Wales, and Northern Ireland. Data includes name, address, degrees, colleges, appointment, memberships, and publications. Also contains information on United Kingdom hospitals, NHS trusts, and boards of health. Accretionary orogens form at convergent plate boundaries and include the supra-subduction zone forearc, magmatic arc and backarc components. They can be broken into retreating and advancing types, based on their kinematic framework and resulting geological character. Accretionary systems have been active throughout Earth history, extending back until at least 3.2 Ga, and provide an important constraint on the initiation of horizontal motion of lithospheric plates on Earth. Accretionary orogens have

Accretionary systems have been active throughout Earth history, extending back until at least 3.2 Ga, and provide an important constraint on the initiation of horizontal motion of lithospheric plates on Earth. Accretionary orogens have

been responsible for major growth of the continental lithosphere, through the addition of juvenile magmatic products, but are also major sites of consumption and reworking of continental crust through time. The aim of this volume is to provide a better understanding of accretionary processes and their role in the formation and evolution of the continental crust. Fourteen papers deal with general aspects of accretion and metamorphism and discuss examples of accretionary orogens and crustal growth through Earth history, from the Archaean to the Cenozoic. *Betrifft die Handschrift Cod. 307 der Burgerbibliothek Bern (Vol 20, S. 647-653).* Learn how to program with Python from beginning to end. This book is for beginners who want to get up to speed quickly and become intermediate programmers fast! During the past decade northern Europe has started to assume an identity of its own. Categories of East and West have become blurred, challenging as well the idea of what it means to be Nordic. *Post-Cold War Identity Politics* maps this process in Scandinavia. Looking at projects designed to help regional development in the Nordic countries, it assesses whether a new way of defining 'Northern-ness' is emerging. The book highlights the existence of co-existing and - to some extent - competing region-building projects in northern Europe. It demonstrates how they are all efforts by existing nations to redefine their role in Europe at a time of change, and points to how they might develop

in the future. The region of the São Francisco river valley in eastern Brazil encompasses two main components of the geologic framework of the South American continent: the São Francisco craton and its marginal orogenic belts. Cratons, as the oldest, differentiated and relatively stable pieces of the continental lithosphere, preserve a substantial part of the Earth's memory. Orogenic belts, on the other hand, record collisional processes that occurred during a limited time span. Because of their topographic relief, mountain belts developed along craton margins provide however access to rock successions not exposed in the low lands of the adjacent cratons. The combination of geologic information obtained in cratonic domains and their marginal orogenic belts thus form the basis for deciphering substantial periods of Earth's history. Corresponding to the most intensively studied portion of the Precambrian nucleus of the South American plate, the São Francisco craton and its margins host a rock record that spans from the Paleoproterozoic to the Cenozoic. Precambrian sedimentary successions that witness ancient Earth processes - many of them of global significance - are especially well preserved and exposed in this region. With all these attributes the São Francisco craton together with its fringing orogenic belts can be viewed as a 'continent within a continent' or a 'continent in miniature'. Questo volume nasce con l'intento di fornire a professionisti e studenti uno strumento utile per un'analisi ragionata

dell'istituto della rescissione del contratto, attraverso l'approfondimento giurisprudenziale e dottrinale e con particolare attenzione alla semantica del dato normativo. A tal fine, si dà rilievo al testo della relazione di accompagnamento al codice civile, che rappresenta ancora oggi un valido strumento di interpretazione autentica. Ulteriore ausilio al lettore è fornito da numerosi esempi pratici e dalla vasta e aggiornata casistica giurisprudenziale. La rescissione del contratto riacquista centralità nell'attuale dibattito interpretativo, inscrivendosi nell'ambito della dialettica tra autonomia negoziale e giustizia contrattuale. Molteplici i punti di contatto e le implicazioni con i temi delle asimmetrie contrattuali e degli squilibri originari del contratto, sotto il profilo dell'ampiezza del sindacato del giudice e dei rimedi esperibili, che consentono al lettore di meglio orientarsi nel processo di trasformazione del diritto civile. The analysis presented here suggests that nearly all of the Eurasian "intra-cratonic" structures, classically viewed by some geologists to have resulted from primary vertical movements, may be products of horizontal movements caused by repeated orogenies around the periphery of cratons. Understanding the evolution of the Cimmerides together with their fore- and hinterlands sheds much light on the Mesozoic tectonics of all of Asia and eastern Europe and leads to a number of interesting concepts concerning continental evolution, such as "hidden subduction." Finally,

a study on the evolution of ideas on the Cimmerides clearly shows how much we remain under the spell of the Kober-Stillean fixist philosophy. This volume presents the results of geological mapping and research work performed in southwestern Ghana. The studied area covers about 2000 km<sup>2</sup> and comprises the land surface south of latitude 5° N and between longitude 1°30' W and 2°30' W. It is prospective for gold and manganese and includes supracrustal and intrusive rocks of the Birimian Supergroup, subordinately sedimentary rocks of the Tarkwaian Group, as well as minor, late-kinematic basin-type granitoids - all of Paleoproterozoic age. Furthermore, Paleozoic and Cretaceous sediments are present locally. The two geological sheets at the scale of 1:100,000 (Axim and Sekondi) and cover the southern tip of the Ashanti volcanic belt which is the prime gold producer of Ghana, the southernmost part of the Kumasi sedimentary basin and migmatitic gneisses representing a comparatively deep crustal level of the Cape Coast sedimentary basin. Most of the investigated terrane, however, is occupied by three major synvolcanic/belt-type granitoid plutons from which precise U-Pb zircon crystallization ages of 2172 ± 2 Ma and 2174 ± 2 Ma are available. Regional foliation trends NE-SW or NNE-SSW, being the result of Eburnean NW-SE compression of the terrane. Three major high-strain zones occur, one of which represents the southern continuation of the important gold-bearing Prestea-Obuasi-

Konongo high-strain zone. 26 gold occurrences and four manganese occurrences - abandoned European as well as active and abandoned native ones - were inventorized and their characteristics and features are presented in tabular form. The two most important regional controls for gold deposition seem to be the high-strain zone in and adjacent to the belt/basin transition zone on the western flank of the Ashanti belt, in accordance with conceptions previously established by GSD and BGR, as well as sheared granitoid/greenstone contacts. Summary of recent research covering experimental methods and numerical modelling, for graduate students and researchers. Vols. for 1964- have guides and journal lists. Phoscorites are dark, often very handsome, sometimes economically valuable, magnetite-apatite-silicate rocks, almost always associated with carbonatite. They are key to understanding the longstanding question of how carbonate and carbonate-bearing magmas rise to the crust and the Earth's surface. Despite this, they have been given little attention; a search on geological literature databases will produce thousands of references to carbonatite (up to 4125 on Georef) but not more than thirty references to phoscorite. This book goes some way to redress this balance. Over recent years many European and North American scientists have studied Kola rocks in collaboration with Russian colleagues. The idea for this book came from one such project funded by the European organisation, INTAS (Grant No 97-0722). The

Kola Peninsula is one of the outstanding areas in the World for the concentration and economic importance of alkaline rocks. However, Russian work on the Kola complexes is still relatively unknown and a particular aim of this book, as well as presenting current research, is to make this knowledge accessible to English language readers. A large exploration programme on Kola alkaline rocks was active from 1950 to 1990 and involved teams of geologists who studied many kilometres of drill core and carried out detailed mineralogical and petrological studies. As a convenient source of wide-ranging critical opinion on early literature, this series contains excerpts from criticism through the ages on the works of philosophers, poets and playwrights, political leaders, scientists, mathematicians and writers from
