*Quality Control Civil Work* Swamy Rk, 2019-07-27 Quality control QC is the part of quality management that ensures products and service comply with requirements It is a work method that facilitates the measurement of the quality characteristics of a unit compares them with the established standards and analyses the differences between the results obtained and the desired results in order to make decisions which will correct any differences Technical specifications define the type of controls that must be carried out to ensure the construction works are carried out correctly They include not only products and materials but also the execution and completion of the works One way of controlling quality is based on the inspection or verification of finished products The aim is to filter the products before they reach the client so that products that do not comply with requirements are discarded or repaired This reception control is usually carried out by people who were not involved in the production activities which means that costs can be high and preventative activities and improvement plans may not be effective It is a final control located between producer and client and although it has the advantage of being impartial it has a large number of drawbacks such as slow information flows and that the inspectors are not familiar with the circumstances of production and are not responsible for the production quality When tests are destructive the decision to accept or reject a full batch must be made on the basis of the quality of a random sample This type of statistical control provides less information and contains sampling risks However it is more economical requires fewer inspectors and speeds up decision making while the rejection of the whole batch encourages suppliers to improve their quality This type of control can also identify the causes of variations and so establish procedures for their systematic elimination Statistical control can be applied to the final product acceptance control or during the production process process control Statistical controls at reception establish sampling plans with clearly defined acceptance or rejection criteria and complete batches are tested by means of random sampling The sampling control can be based on inspection by attributes in line with the ISO 2859 standard Sampling procedures for inspection by attributes or on inspection by variables in line with the ISO 3951 standard Sampling procedures for inspection by variables A construction company should reduce the costs of bad quality as much as possible and ensure that the result of its processes comply with the client's requirements Both internal and external controls can be carried out For example the control of concrete received by the contractor can be carried out by an independent entity the execution of steelworks can be controlled by the project manager on behalf of the client or the construction company can establish an internal control for the execution of the building work

*Construction Inspection Handbook* James J. O'Brien, 1989 In addition to quality control QC this book introduces the concept of quality assurance QA Quality assurance has a number of definitions but in general is the combination of the quality assurance plan with procedures through which the quality control inspector can inspect in the field The book is arranged in categories so that it can be used in handbook fashion each section stands independent of the others The arrangement of the major portion of the book is organized in the same format as we usually find in building construction specification the Construction Specifications Institute CSI format
