Wind Loads on Circular Storage Bins, Silos and Tanks. II. Effect of Grouping P. A. MacDonald, John Dean Holmes, K. C. S. Kwok, Commonwealth Scientific and Industrial Research Organization (Australia). Division of Building, Construction and Engineering, 1977
Following previous work in which point pressure measurements on isolated low aspect ratio circular structures such as storage bins silos and tanks were described this report describes measurements of wind loads on silos arranged in an in line group of five As well as point pressures area averaged pressures on wall panels of finite area were carried out using the pneumatic averaging technique At small spacings between silos the region of positive pressure on the windward side spans a larger angular sector of the circumference than that for an isolated silo For wind directions near normal to the line of the silos high negative mean pressures and high r m s pressures occur near the point of shortest distance to the adjacent silos
