Lamprou, István Sebe, 2020-03-27 Several promising techniques have been developed to overcome the poor solubility and or membrane permeability properties of new drug candidates including different fiber formation methods Electrospinning is one of the most commonly used spinning techniques for fiber formation induced by the high voltage applied to the drug loaded solution With modifying the characteristics of the solution and the spinning parameters the functionality related properties of the formulated fibers can be finely tuned The fiber properties i e high specific surface area porosity and the possibility of controlling the crystalline amorphous phase transitions of the loaded drugs enable the improved rate and extent of solubility causing a rapid onset of absorption However the enhanced molecular mobility of the amorphous drugs embedded into the fibers is also responsible for their physical chemical instability This Special Issue will address new developments in the area of electrospun nanofibers for drug delivery and wound healing applications covering recent advantages and future directions in electrospun fiber formulations and scalability Moreover it serves to highlight and capture the contemporary progress in electrospinning techniques with particular attention to the industrial feasibility of developing pharmaceutical dosage forms All aspects of small molecule or biologics loaded fibrous dosage forms focusing on the processability structures and functions and stability issues are included

The Plant Viruses M.H.V. Van Regenmortel, Heinz Fraenkel-Conrat, 2013-11-11 This volume of the series *The Plant*

Viruses is devoted to viruses with rod shaped particles belonging to the following four groups the tobacco mosaic virus the tobamoviruses after tobacco the hordeoviruses after the latin hordeum in honor of the type member barley stripe mosaic virus and the not yet officially recognized furoviruses fungus transmitted rod shaped viruses Shirako and Brakke 1984 At present these clusters of plant viruses are called groups instead of genera or families as is customary in other areas of virology This peculiarity of plant viral taxonomy Matthews 1982 is due to the fact that the current Plant Virus Subcommittee of the International Committee of Taxonomy of Viruses is deeply split on what to call the categories or ranks used in virus classification Some plant virologists believe that the species concept cannot be applied to viruses because this concept according to them necessarily involves sexual reproduction and genetic isolation Milne 1984 Murant 1985 This belief no doubt stems from the fact that these authors restrict the use of the term species to biological species According to them a collection of similar viral isolates and strains does constitute an individual virus i.e. it is a taxonomy entity separate from other individual viruses
