Herrera,2013-03-09 Coastal aquifers serve as major sources for freshwater supply in many countries around the world especially in arid and semi arid zones Many coastal areas are also heavily urbanized a fact that makes the need for freshwater even more acute Coastal aquifers are highly sensitive to disturbances Inappropriate management of a coastal aquifer may lead to its destruction as a source for freshwater much earlier than other aquifers which are not connected to the sea The reason is the threat of seawater intrusion In many coastal aquifers intrusion of seawater has become one of the major constraints imposed on groundwater utilization As sea water intrusion progresses existing pumping wells especially those close to the coast become saline and have to be abandoned Also the area above the intruding seawater wedge is lost as a source of natural replenishment to the aquifer Despite the importance of this subject so far there does not exist a book that integrates our present knowledge of seawater intrusion its occurrences physical mechanism chemistry exploration by geo physical and geochemical techniques conceptual and mathematical modeling analytical and numerical solution methods engineering measures of combating seawater intrusion management strategies and experience learned from case studies By presenting this fairly comprehensive volume on the state of the art of knowledge and ex per ience on saltwater intrusion we hoped to transfer this body of knowledge to the geologists hydrologists hydraulic engineers water resources planners managers and governmental policy makers who are engaged in the sustainable development of coastal fresh ground water resources

Saline Groundwater - Surface Water Interaction in Coastal Lowlands J.R. Delsman, 2015-05-07 Coastal zones are among the world s most densely populated and economically important areas but these factors put pressure on the often limited available freshwater resources Global change will undoubtedly increase this pressure through the combined effects of increased population economic development rising sea levels increased evapotranspiration over extraction and the salinization of coastal aquifers decreasing river discharges and accelerating land subsidence Saline groundwater exfiltration is a common problem in the coastal zone of the Netherlands but the hydrological processes and physiographic factors that affect this are not fully understood The research presented in this book aims to identify the processes and physiographic factors controlling the spatial variability and temporal dynamics of the exfiltration of saline groundwater to surface water and hence the contribution of saline groundwater to surface water salinity Topics covered include a paleo hydrogeological model simulation of the Holocene evolution of groundwater salinity as a result of paleo geographic changes surface water salinity dynamics in a densely drained lowland catchment hydrograph separation in an agricultural catchment observations of heads flow solute concentration and temperature to constrain a detailed variable density groundwater flow and transport model and a model to simulate the salinity dynamics of exfiltrating groundwater to support operational water management of freshwater resources in coastal lowlands The book further outlines the implications of these findings for freshwater management in the Netherlands The book demonstrates that the salinity of groundwater exfiltrating in polders in the Netherlands and hence surface water salinity varies on a wide range of spatial and temporal scales
