Concepts of Biology Samantha Fowler, Rebecca Roush, James Wise, 2018-01-07 Concepts of Biology is designed for the single semester introduction to biology course for non science majors which for many students is their only college level science course As such this course represents an important opportunity for students to develop the necessary knowledge tools and skills to make informed decisions as they continue with their lives Rather than being mired down with facts and vocabulary the typical non science major student needs information presented in a way that is easy to read and understand Even more importantly the content should be meaningful Students do much better when they understand why biology is relevant to their everyday lives For these reasons Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand We also strive to show the interconnectedness of topics within this extremely broad discipline In order to meet the needs of today s instructors and students we maintain the overall organization and coverage found in most syllabi for this course A strength of Concepts of Biology is that instructors can customize the book adapting it to the approach that works best in their classroom Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand and apply key concepts

*The Gastrointestinal Circulation* Peter R. Kviety, 2010 The microcirculation of the gastrointestinal tract is under the control of both myogenic and metabolic regulatory systems The myogenic mechanism contributes to basal vascular tone and the regulation of transmural pressure while the metabolic mechanism is responsible for maintaining an appropriate balance between O<sub>2</sub> demand and O<sub>2</sub> delivery In the postprandial state hydrolytic products of food digestion elicit a hyperemia which serves to meet the increased O<sub>2</sub> demand of nutrient assimilation Metabolically linked factors e g tissue pO<sub>2</sub> adenosine are primarily responsible for this functional hyperemia The fenestrated capillaries of the gastrointestinal mucosa are relatively permeable to small hydrolytic products of food digestion e g glucose yet restrict the transcapillary movement of larger molecules e g albumin This allows for the absorption of hydrolytic products of food digestion without compromising the oncotic pressure gradient governing transcapillary fluid movement and edema formation The gastrointestinal microcirculation is also an important component of the mucosal defense system whose function is to prevent and rapidly repair inadvertent epithelial injury by potentially noxious constituents of chyme Two pathological conditions in which the gastrointestinal circulation plays an important role are ischemia reperfusion and chronic portal hypertension Ischemia reperfusion results in mucosal edema and disruption of the epithelium due in part to an inflammatory response e g increase in capillary permeability to macromolecules and neutrophil infiltration Chronic portal hypertension results in an increase in gastrointestinal blood flow due to an imbalance in vasodilator and vasoconstrictor influences on the microcirculation Table of Contents Introduction Anatomy Regulation of Vascular Tone and Oxygenation Extrinsic Vasoregulation Neural and Humoral Postprandial Hyperemia Transcapillary Solute Exchange Transcapillary Fluid Exchange Interaction of Capillary and Interstitial Forces Gastrointestinal Circulation and Mucosal Defense Gastrointestinal Circulation and Mucosal Pathology I Ischemia Reperfusion Gastrointestinal Circulation and Mucosal Pathology II Chronic Portal Hypertension Summary and Conclusions References Author Biography
