Mathematical Programming Solver Based on Local Search Frédéric Gardi,Thierry Benoist,Julien Darlay,Bertrand Estellon,Romain Megel,2014-07-09 This book covers local search for combinatorial optimization and its extension to mixed variable optimization Although not yet understood from the theoretical point of view local search is the paradigm of choice for tackling large scale real life optimization problems Today s end users demand interactivity with decision support systems For optimization software this means obtaining good quality solutions quickly Fast iterative improvement methods like local search are suited to satisfying such needs Here the authors show local search in a new light in particular presenting a new kind of mathematical programming solver namely LocalSolver based on neighborhood search First an iconoclast methodology is presented to design and engineer local search algorithms The authors concern regarding industrializing local search approaches is of particular interest for practitioners This methodology is applied to solve two industrial problems with high economic stakes Software based on local search induces extra costs in development and maintenance in comparison with the direct use of mixed integer linear programming solvers The authors then move on to present the LocalSolver project whose goal is to offer the power of local search through a model and run solver for large scale 0 1 nonlinear programming They conclude by presenting their ongoing and future work on LocalSolver toward a full mathematical programming solver based on local search

Decomposition Techniques in Mathematical Programming Antonio J. Conejo, Enrique Castillo, Roberto Minguez, Raquel Garcia-Bertrand, 2006-04-28 Optimization plainly dominates the design planning operation and control of engineering systems This is a book on optimization that considers particular cases of optimization problems those with a decomposable structure that can be advantageously exploited Those decomposable optimization problems are ubiquitous in engineering and science applications The book considers problems with both complicating constraints and complicating variables and analyzes linear and nonlinear problems with and without integer variables The decomposition techniques analyzed include Dantzig Wolfe Benders Lagrangian relaxation Augmented Lagrangian decomposition and others Heuristic techniques are also considered Additionally a comprehensive sensitivity analysis for characterizing the solution of optimization problems is carried out This material is particularly novel and of high practical interest This book is built based on many clarifying illustrative and computational examples which facilitate the learning procedure For the sake of clarity theoretical concepts and computational algorithms are assembled based on these examples The results are simplicity clarity and easy learning We feel that this book is needed by the engineering community that has to tackle complex optimization problems particularly by practitioners and researchers in Engineering Operations Research and Applied Economics The descriptions of most decomposition techniques are available only in complex and specialized mathematical journals difficult to understand by engineers A book describing a wide range of decomposition techniques emphasizing problem solving and appropriately blending theory and application was not previously available

Decision Making and Programming V. V. Kolbin, 2003 The problem of selection of alternatives or the problem of decision making in the modern world has become the most important class of problems constantly faced by business people researchers doctors and engineers The fields that are almost entirely focused on conflicts where applied mathematics is successfully used are law military science many branches of economics sociology political science and psychology There are good grounds to believe that medicine and some branches of biology and ethics can also be included in this list Modern applied mathematics can produce solutions to many tens of classes of conflicts differing by the composition and structure of the participants specific features of the set of their objectives or interests and various characteristics of the set of their actions strategies behaviors controls and decisions as applied to various principles of selection or notions of decision optimization The current issues of social and economic systems involve the necessity to coordinate and jointly optimize various lines of development and activities of modern society For this reason the decision problems arising in investigation of such systems are versatile which shows up not only in the multiplicity of participants their interests and complexity of reciprocal effects but also in the laborious development of social utility criteria for a variety of indices and versatile objectives The efficient decision methods for such complex systems can be developed only on the basis of specially developed mathematical tools Contents Social Choice Problems Vector Optimization Infinite Valued Programming Problems Stochastic Programming Discrete Programming Fundamentals of Decision Making Multicriterion Optimization Problems Decision Making Under Incomplete Information Multicriterion Elements of Optimization Theory Decision Models Decision Models Under Fuzzy Information The Applied Mathematical Model for Conflict Management Readership Undergraduates graduate students professionals and researchers in applied mathematics

Model Building in Mathematical Programming H. Paul Williams,1999-10-25 Review of previous editions Such a text and this is the only one of this type I know of should be the basis of all instruction in Mathematical Programming Journal of the Royal Statistical Society An excellent introduction for students of business administration and people who want to see the utility of operations research European Journal of Operational Research It will be appreciated very much by practitioners who already have knowledge in the field of mathematical programming Mathematical Programming Society Newsletter Model Building in Mathematical Programming Fourth Edition H Paul Williams Faculty of Mathematical Studies University of Southampton UK This extensively revised fourth edition of this well known and much praised book contains a great deal of new material In particular sections and new problems have been added covering Revenue Management Hydro Electric Generation Date Envelopment efficiency Analysis Milk Distribution and Collection and Constraint Programming The book discusses the general principles of model building in mathematical programming and shows how they can be applied by using simplified but practical problems from widely different contexts Suggested formulations and solutions are given in the latter part of the book together with computational experience to give the reader a feel for the computation difficulty of solving that particular type of model Aimed at undergraduates postgraduates research students and managers this book illustrates the scope and limitations of mathematical programming and shows how it can be applied to real situations By emphasizing the importance of the building and interpretation of models rather than the solution process the author attempts to fill a gap left by the many works which concentrate on the algorithmic side of the subject
