Time Series: Theory and Methods Peter J. Brockwell, Richard A. Davis, 2013-11-11 We have attempted in this book to give a systematic account of linear time series models and their application to the modelling and prediction of data collected sequentially in time. The aim is to provide specific techniques for handling data and at the same time to provide a thorough understanding of the mathematical basis for the techniques. Both time and frequency domain methods are discussed but the book is written in such a way that either approach could be emphasized. The book is intended to be a text for graduate students in statistics, mathematics, engineering, and the natural or social sciences. It has been used both at the M.S. level, emphasizing the more practical aspects of modelling, and at the Ph.D. level where the detailed mathematical derivations of the deeper results can be included. Distinctive features of the book are the extensive use of elementary Hilbert space methods and recursive prediction techniques based on innovations, use of the exact Gaussian likelihood and AIC for inference, a thorough treatment of the asymptotic behavior of the maximum likelihood estimators of the coefficients of univariate ARMA models, extensive illustrations of the techniques by means of numerical examples, and a large number of problems for the reader. The companion diskette contains programs written for the IBM PC which can be used to apply the methods described in the text.

Time Series: Theory and Methods Peter J. Brockwell, Richard A. Davis, 2009-05-13 This edition contains a large number of additions and corrections scattered throughout the text, including the incorporation of a new chapter on state space models. The companion diskette for the IBM PC has expanded into the software package ITSM: An Interactive Time Series Modelling Package for the PC, which includes a manual and can be ordered from Springer-Verlag. We are indebted to many readers who have used the book and programs and made suggestions for improvements. Unfortunately, there is not enough space to acknowledge all who have contributed in this way; however, special mention must be made of our prize-winning fault finders, Sid Resnick and F. Pukelsheim. Special mention should also be made of Anthony Brockwell, whose advice and support on computing matters was invaluable in the preparation of the new diskettes. We have been fortunate to work on the new edition in the excellent environments provided by the University of Melbourne and Colorado State University. We thank Duane Boes particularly for his support and encouragement throughout, and the Australian Research Council and National Science Foundation for their support of research related to the new material. We are also indebted to Springer-Verlag for their constant support and assistance in preparing the second edition. Fort Collins, Colorado. P. J. BROCKWELL, November 1990. R. A. DAVIS. Forecasting: principles and practice Rob J Hyndman, George Athanasopoulos, 2018-05-08 Forecasting is required in many situations. Stocking an inventory may require forecasts of demand months in advance. Telecommunication routing requires traffic forecasts a few minutes ahead. Whatever the circumstances or time horizons involved, forecasting is an important aid in effective and efficient planning. This textbook provides a comprehensive introduction to forecasting methods and presents enough information about each method for readers to use them sensibly.

Time Series Analysis and Inverse Theory for Geophysicists David Gubbins, 2004-03-18 This unique textbook provides the foundation for understanding and applying techniques commonly used in geophysics to process and interpret modern digital data. The geophysicist's toolkit contains a range of techniques which may be divided into two main groups: processing which concerns time series analysis and is used to separate the signal of interest from background noise, and inversion which involves generating some map or physical model from the data. These two groups of techniques are normally taught separately but are here presented together as parts I and II of the book. Part III describes some real applications and includes case studies in seismology, geomagnetism and gravity. This textbook gives students and practitioners the theoretical background and practical experience through case studies, computer examples and exercises to understand and apply new processing methods to modern geophysical datasets. Solutions to the exercises are available on a website at <http://publishing.cambridge.org/resources/0521819652>

A Course in Time Series Analysis Daniel Peña, George C. Tiao, Ruey S. Tsay, 2011-01-25 New statistical methods and future directions of research in time series. A Course in Time Series Analysis demonstrates how to build time series models for univariate and multivariate time series data. It brings together material previously available only in the professional literature and presents a unified view of the most advanced procedures available for time series model building. The authors begin with basic concepts in univariate time series providing an up to date presentation of ARIMA models including the Kalman filter, outlier analysis, automatic methods for building ARIMA models and signal extraction. They then move on to advanced topics focusing on heteroscedastic models, nonlinear time series models, Bayesian time series analysis, nonparametric time series analysis and neural networks. Multivariate time series coverage includes presentations on vector ARMA models, cointegration and multivariate linear systems. Special features include Contributions from eleven of the world's leading figures in time series. Shared balance between theory and application. Exercise series sets. Many real data examples. Consistent style and clear common notation in all contributions. 60 helpful graphs and tables. Requiring no previous knowledge of the subject. A Course in Time Series Analysis is an important reference and a highly useful resource for researchers and practitioners in statistics, economics, business, engineering and environmental analysis. An Instructor's Manual presenting detailed solutions to all the problems in the book is available upon request from the Wiley editorial department.

Introduction to Time Series and Forecasting Peter J. Brockwell, Richard A. Davis, 2013-03-14 Some of the key mathematical results are stated without proof in order to make the underlying theory accessible to a wider audience. The book assumes a knowledge only of basic calculus, matrix algebra and elementary statistics. The emphasis is on methods and the analysis of data sets. The logic and tools of model building for stationary and non-stationary time series are developed in detail and numerous exercises, many of which make use of the included computer package, provide the reader with ample opportunity to develop skills in this area. The core of the book covers stationary processes, ARMA and ARIMA processes, multivariate time series and state space models with an optional chapter on spectral analysis. Additional topics include harmonic regression, the Burg and Hannan-Rissanen algorithms, unit roots regression with ARMA errors, structural models, the EM algorithm, generalized state space models with applications to time series of count data, exponential smoothing, the Holt-Winters and ARAR forecasting algorithms, transfer function models and intervention analysis. Brief introductions are also given to cointegration and to non-linear continuous time and long memory models. The time series package included in the back of the book is a slightly modified version of the package ITSM published separately as ITSM for Windows by Springer-Verlag, 1994. It does not handle such large data sets as ITSM for Windows but like the latter runs on IBM PC compatible computers under either DOS or Windows version 3.1 or later. The programs are all menu-driven so that the reader can immediately apply the techniques in the book to time series data with a minimal investment of time in the computational and algorithmic aspects of the analysis.
