PCR Mutation Detection Protocols Jan 18 2022 1Bimal D. Theophilus and Ralph Rapley provide biological and clinical investigators with a comprehensive collection of new, recent, and updated PCR-based screening methods suitable for detecting the presence of both known and

novel mutations. The methods cover point mutations (e.g., ASO-PCR, SSCP, DGGE, chemical cleavage), deletions (multiplex PCR, FISH, blotting), non-sense mutations (PTT), and more. The new and exciting techniques of DNA array analysis, along with such recently developed experimental methods as conformation-sensitive gel electrophoresis, are also included. Each chapter explains the basic theory behind the technique and provides valuable notes essential for its successful execution.

Differential Display May 02 2023 One of the most challenging tasks facing the modern biological research laboratory is to make sense of the enormous amount of data being generated by various genome projects currently underway, and especially the human genome project. Understanding the ways in which genes are differentially expressed in various tissues and cell types, throughout ontogenetic development and in pathological processes, will go a long way towards understanding the function of all these 'new' genes and their protein products. Differential Display explains in detail how to perform the technique of RT-PCR Differential Display in various kinds of experimental biological systems. It also examines this technique in the context of other methods of studying differential gene expression such as subtractive hybridisation and the use of high-density gene microarrays combined with hybridisation techniques and automatic image analysis.

IGY Calendar Record: Ozone Instruction Manual Jan 30 2023 Annals of the International

Geophysical Year, Volume 26: IGY Calendar Record: Ozone Instruction Manual presents various indices and highlights of the solar, geophysical and associated events which took place during the IGY, a period of intensified observation of the earth and its environment. This book is organized into two main parts encompassing six chapters. The first part describes the features of the charts and tables in this Calendar Record of the IGY. The Supplementary Tables are additional indices of world-wide auroral observations which could not conveniently be adapted to the Calendar Record itself. They also summarize for historical purposes the end product of the IGY World Days Program, namely the Calendar of Regular World Days and Intervals decided on before the IGY began and the declarations of Solar Alerts and Special World Intervals. The second part considers the determination of some constants used in the calculation of the amount of ozone from spectrophotometer measurements and an analysis of the accuracy of the results. This book is of value to geophysicists and researchers.

F-35 Jun 03 2023 The inside story of the most expensive and controversial military program in history, as told by those who lived it. The F-35 has changed allied combat warfare. But by the time it 's completed, it will cost more than the Manhattan Project and the B-2 Stealth Bomber. It has been subject to the most aggressive cyberattacks in history from China, Russia, North Korea, and others. Its stealth technology required nearly 9 million lines of code; NASA ' s Curiosity Mars rover required 2.5 million. And it was this close to failure. F-35 is the only inside look at the most advanced aircraft in the world and the historic project that built it, as told by those who were intimately involved in its design, testing, and production. Based on the authors' personal experience and over 100+ interviews, F-35 pulls back the curtain on one of the most heavily criticized government programs in history from start to finish: the dramatic flights that won Lockheed Martin the contract over Boeing; the debates and decisions over capabilities; feats of software, hardware, and aeronautical engineering that made it possible; how the project survived the Nunn-McCurdy breach; the conflicts among all three branches of the U.S. military, between the eight other allied nation partners, and against spy elements from enemies. For readers of Skunk Works by Ben Rich and The Making of the Atomic Bomb by Richard Rhodes, F-35 will pique the interest of airplane enthusiasts, defense industry insiders, military history aficionados, political junkies, and general nonfiction readers.

Plant Molecular Biology Manual Jun 10 2021 During the past ten years, great advances have been made in the area of plant molecular biology. Such formerly esoteric techniques as gene transfer and plant regeneration are now routinely performed, making the dissection of regulatory elements of genes a common practice in many laboratories. Along with this new technology has come an almost bewildering array of rapidly changing techniques, often making it difficult for the novice to select and perform the technique most appropriate for answering a given biological question. In 1986, some of us felt that many of these techniques had become routine enough to warrant the publication of a laboratory manual. The manual is designed both for advanced college level laboratory courses and as a 'bench guide' for use in the scientific laboratory. Recognizing the rapidly changing nature of plant molecular biology technology, the editors have designed a laboratory manual that is both easy to use in the laboratory and which will be updated as the techniques change and new technologies are devised. Additional chapters that can replace or be added to this first edition will be published periodically. The editors recognize that many of the techniques described in this manual depend upon specialized plant genetic material, microbial strains, or recombinant plasmids. Those people desiring such material should contact the relevant authors directly. A list of the various contributors to this manual, including their addresses, is included.

The Role of MicroRNAs in Plants Feb 16 2022 Discovered in plants at the turn of the century, microRNAs (miRNAs) have been found to be fundamental to many aspects of plant biology. These small (20-24 nt) regulatory RNAs are derived via processing from longer imperfect double-stranded RNAs. They are then incorporated into silencing complexes, which they guide to (m)RNAs of high sequence complementarity, resulting in gene silencing outcomes, either via RNA degradation and/or translational inhibition. Some miRNAs are ancient, being present in all species of land plants and controlling fundamental processes such as phase change, organ polarity, flowering, and leaf and root development. However, there are many more miRNAs that are much less conserved and with less understood functions. This Special Issue contains seven research papers that span from understanding the function of a single miRNA family to

examining how the miRNA profiles alter during abiotic stress or nutrient deficiency. The possibility of circular RNAs in plants acting as miRNA decoys to inhibit miRNA function is investigated, as was the hierarchical roles of miRNA biogenesis factors in the maintenance of phosphate homeostasis. Three reviews cover the potential of miRNAs for agronomic improvement of maize, the role of miRNA-triggered secondary small RNAs in plants, and the potential function of an ancient plant miRNA.
