The Fourth Industrial Revolution Klaus Schwab, 2017-01-03

World renowned economist Klaus Schwab Founder and Executive Chairman of the World Economic Forum explains that we have an opportunity to shape the fourth industrial revolution which will fundamentally alter how we live and work Schwab argues that this revolution is different in scale scope and complexity from any that have come before Characterized by a range of new technologies that are fusing the physical digital and biological worlds the developments are affecting all disciplines economies industries and governments and even challenging ideas about what it means to be human Artificial intelligence is already all around us from supercomputers drones and virtual assistants to 3D printing DNA sequencing smart thermostats wear able sensors and

microchips smaller than a grain of sand But this is just the beginning nanomaterials 200 times stronger than steel and a million times thinner than a strand of hair and the first transplant of a 3D printed liver are already in development Imagine smart factories in which global systems of manufacturing are coordinated virtually or implantable mobile phones made of biosynthetic materials The fourth industrial revolution says Schwab is more significant and its ramifications more profound than in any prior period of human history He outlines the key technologies driving this revolution and discusses the major impacts expected on government business civil society and individuals Schwab also offers bold ideas on how to harness these changes and shape a better future one in which technology empowers people rather than replaces them progress serves society rather than disrupts it and in which innovators respect moral and ethical boundaries rather than cross them We all have the opportunity to contribute to developing new frameworks that advance progress

Teaching Engineering, Second Edition Phillip C. Wankat, Frank S. Oreovicz, 2015-01-15 The majority of professors have never had a formal course in education and the most common method for learning how to teach is on the job training This represents a challenge for disciplines with ever more complex subject matter and a lost opportunity when new active learning approaches to education are yielding dramatic improvements in student learning and retention This book aims to cover all aspects of teaching engineering and other technical subjects It presents both practical matters and educational theories in a format useful for both new and experienced teachers It is organized to start with specific practical teaching applications and then leads to psychological and educational theories The practical orientation section explains how to develop objectives and then use them to enhance student learning and the theoretical orientation section discusses the theoretical basis for learning teaching and its impact on students Written mainly for PhD students and professors in all areas of engineering the book may be used as a text for graduate level classes and professional workshops or by professionals who wish to read it on their own Although the focus is engineering education most of this book will be useful to teachers in other disciplines Teaching is a complex human activity so it is impossible to develop a formula that guarantees it will be excellent However the methods in this book will help all professors become good teachers while spending less time preparing for the classroom This is a new edition of the well received volume published by McGraw Hill in 1993 It includes an entirely revised section on the Accreditation Board for Engineering and Technology ABET and new sections on the characteristics of great teachers different active learning methods the application of technology in the classroom from clickers to intelligent tutorial systems and how people learn
