*Fundamentals of Cryptology* Henk C.A. van Tilborg, 2006-04-18 The protection of sensitive information against unauthorized access or fraudulent changes has been of prime concern throughout the centuries Modern communication techniques using computers connected through networks make all data even more vulnerable for these threats Also new issues have come up that were not relevant before e.g. how to add a digital signature to an electronic document in such a way that the signer can not deny later on that the document was signed by him/her Cryptology addresses the above issues It is at the foundation of all information security The techniques employed to this end have become increasingly mathematical of nature This book serves as an introduction to modern cryptographic methods After a brief survey of classical cryptosystems it concentrates on three main areas First of all stream ciphers and block ciphers are discussed These systems have extremely fast implementations but sender and receiver have to share a secret key Public key cryptosystems the second main area make it possible to protect data without a prearranged key Their security is based on intractable mathematical problems like the factorization of large numbers The remaining chapters cover a variety of topics such as zero knowledge proofs secret sharing schemes and authentication codes Two appendices explain all mathematical prerequisites in great detail One is on elementary number theory Euclid's Algorithm the Chinese Remainder Theorem quadratic residues inversion formulas and continued fractions The other appendix gives a thorough introduction to finite fields and their algebraic structure
