Sewer Processes Thorkild Hvitved-Jacobsen, Jes Vollertsen, Asbjørn Haaning Nielsen, 2013-04-23 Since the first edition was published over a decade ago advancements have been made in the design operation and maintenance of sewer systems and new problems have emerged For example sewer processes are now integrated in computer models and simultaneously odor and corrosion problems caused by hydrogen sulfide and other volatile organic compounds

Assessing Infiltration and Exfiltration on the Performance of Urban Sewer Systems Bryan Ellis, Jean-Luc Bertrand-Krajewski, 2010-02-10 Sewer systems constitute a very significant heritage in European cities Their structural quality and functional efficiency are key parameters to guarantee the transfer of domestic and industrial wastewater to treatment plants without infiltration nor exfiltration Infiltration of groundwater is particularly detrimental to treatment plant efficiency while exfiltration of wastewater can lead to groundwater contamination The European research project APUSS Assessing infiltration and exfiltration on the Performance of Urban Sewer Systems was devoted to sewer infiltration and exfiltration questions It was structured in three main Work Areas dealing respectively with i the development of new measurement methods based on tracer experiments and accounting for detailed uncertainty analyses ii the implementation of models and software tools to integrate structural and experimental data and to facilitate data display operational management and decision making processes and iii the integration of economic and operational questions by means of cost estimation economic evaluation performance indicators and multi criteria methods applied to investment rehabilitation strategies This final report describes the objectives methods and main results for each Work Area References to detailed methods protocols reports and tools are given in this final report which will be an invaluable source of information for all those concerned with the performance of urban sewer systems

Systems United States. Bureau of Yards and Docks,1956 **Federal Register Index** , Wastewater Infrastructure Financing David Trimble,2010-11 Communities will need hundreds of billions of dollars in coming years to construct and upgrade wastewater infrastructure Policymakers have proposed a variety of approaches to finance this infrastructure incl the creation of a national infrastructure bank NIB and the increased use of privately financed public private partnerships PPP In this context this report identified 1 Stakeholder views on issues to be considered in the design of an NIB and 2 the extent to which private financing has been used in wastewater PPPs and its reported advantages and challenges In conducting this work a questionnaire was administered to 37 stakeholders with expertise in wastewater utilities infrastructure needs and financing Charts and tables

Characterizing Mechanisms of Simultaneous Biological Nutrient Removal During Wastewater Treatment P. F. Strom,2004-01-01 Simultaneous biological nutrient removal SBNR is the removal of nitrogen and or phosphorus in excess of that required for biomass synthesis in biological wastewater treatment systems where there are no defined anaerobic and or anoxic zones The hypothesis is that one or more of three mechanisms is responsible within individual systems variations in the bioreactor macroenvironment created by the mixing pattern gradients within the floc microenvironment and or novel microorganism activity Understanding of the mechanisms of SBNR can be expected to lead to improved efficiency and reliability in its application Preliminary work documented SBNR in 7 full scale OrbaltTM closed loop bioreactors A batch assay demonstrated that novel microorganism activity was of little importance in SBNR at the three plants tested While the floc microenvironment likely plays an important role in nitrogen removal in such plants it cannot explain phosphorus removal A computational fluid dynamics CFD model was developed to elucidate the role of the bioreactor macroenvironment in SBNR This is the first reported application of CFD to activated sludge biological wastewater treatment Although the software and computational requirements limited model complexity it still simulated the creation of dissolved oxygen gradients within the system demonstrating that the anaerobic zones required for SBNR could occur

Multiple Stressors S. M. Swanson,2004-07-31 There is a pressing need for developing and testing a general set of theories in order to provide a confident basis for prediction of multiple stressor effects Confident prediction is central to confident decision making in water pollution control Consequently WERF commissioned this study which has as its goal to provide a study design based on good science that helps establish a general conceptual approach to multiple stressors The objectives of the study are to develop a flexible and scientifically defensible conceptual model of the environmental effects of multiple stressors on river and stream ecosystems develop a study design to test the conceptual model of multiple stressor effects and document the process used to arrive at the conceptual model The multiple stressor conceptual model includes two main components 1 a diagram that portrays the main features of the study team s understanding of how multiple stressors would interact and the nature of the effects and 2 a series of three testable risk hypotheses These two components follow the guidance provided by the U S EPA for ecological risk assessment The proposed conceptual model encompasses the following

key assumptions interactions between the stressor and the ecosystem are dependant upon the existing baseline conditions for each stressor baseline combination there will theoretically be a functional and a structural response effects on habitat are caused by structural or functional responses to stressors and effects on habitat can cause structural or functional responses

Official Gazette of the United States Patent and Trademark Office ,2003 [Use of Enhanced Biological Phosphorus Removal for Treating Nutrient-Deficient Wastewater](#) W. F. Harper Jr,David Jenkins,2004-01-01 Anaerobic aerobic AnA and completely aerobic CA laboratory scale sequencing batch reactors operating on an acetate and casamino acids based synthetic wastewater were used to investigate the suitability of the AnA process for treating nutrient deficient wastewaters in plants that have stringent effluent nutrient requirements Of particular interest is the case where phosphorus P deficient wastewaters with highly variable influent COD loading are being treated to meet both effluent TSS and P limits At a 4 d mean cell residence time AnA activated sludge had an approx 20% lower P requirement than CA activated sludge The difference between the end of aerobic cycle polyhydroxyalkanoate and carbohydrate contents of the sludges indicated that the AnAsludge used more influent carbon than the CA sludge for synthesis of non P containing storage products The nitrogen requirements of AnA sludge were similar to those of the CA sludge The AnA and CA SBRs were subjected to three different transient influent COD loading patterns that simulated 1 daily COD Loading fluctuations 2 low weekend COD loading and 3 extended low COD loading periods During the Loading Pattern 1 experiment the average effluent soluble P concentrations for the AnA and CA SBRs were 0.4 and 1.0 mgP/L respectively and complete removal of influent acetate was observed During the Loading Pattern 2 experiment the average effluent soluble P concentrations for the AnA and CA SBRs were 0.3 and 0.9 mgP/L respectively but effluent acetate was detected during the first high COD loading cycle following the low weekend COD loading period During the Loading Pattern 3 experiment the VSS content of both reactors dropped sharply effluent acetate breakthrough occurred and effluent P concentrations exceeding 1 mgP/L were detected in both the AnA and CA SBRs Based on these findings the AnA process has potential as a technologically and economically superior alternative for wastewater treatment plants treating P deficient wastewaters to meet stringent effluent TSS and P limits This publication can also be purchased and downloaded via Pay Per View on Water Intelligence Online click on the Pay Per View icon below

Fate and Persistence of Pathogens Subjected to Disinfection Karl G. Linden,2004-01-01 Disinfection of wastewater is a necessary treatment process for protecting the public from potential exposure to pathogenic microorganisms because many wastewater effluents are discharged into water bodies that may be used for recreation or as future drinking water supplies Two common forms of disinfection are chlorine and ultraviolet UV light However microorganisms differ in their susceptibility to UV and chlorine disinfectants It is necessary to understand how different classes of pathogens respond to UV and chlorine disinfection processes in wastewater to better develop strategies for optimizing the treatment of pathogens in wastewater It is also recognized that water quality may impact disinfection effectiveness such as protection of pathogen by particles and

disinfectant demand This study investigated bacteria viruses and protozoan pathogens All species of bacteria tested were susceptible to both UV and chlorine despite differences in antibiotic resistance and tendency to aggregate Upon exposure to disinfection conditions that could indicate viability of the bacteria tested but not culturability using common methods it was found that UV and chlorine were effective in eliminating the capability of viable but non culturable bacteria to resuscitate and become re infective Clostridium spores were resistant to free chlorine and UV disinfection but found to be susceptible to long exposure to monochloramine Cryptosporidium was resistant to all chlorine forms but very susceptible to UV irradiation Pathogenic and indicator viruses tested were very susceptible to free chlorine and UV disinfection UV radiation throughout the 200 to 300 nm range was effective for inactivation of viruses and C parvum but wavelengths between 260 270 nm and below 220 nm appeared to be more effective for viruses suggesting a possible advantage for polychromatic UV sources Sequential disinfection strategies were proposed and tested to enhance inactivation of various microorganisms One scenario integrated UV disinfection followed by dynamic chloramination through addition of free chlorine and subsequent transformation to combined chlorine Further disinfection of microorganisms in wastewater presents challenges that are inherent to the water matrix such as pathogens associated with particles UV and chlorine were both effective for disinfection of coliform in wastewater but chlorine was found to be more effective during long contact times for inactivation of particle associated coliform In addition to coliform both Cryptosporidium parvum and Salmonella typhimurium were identified as being particle associated in wastewater using molecular approaches developed to detect microbes in environmental samples

Global Lessons for Watershed Management in the United States J. Goldstein,A. Huber-Lee,2004-09-30 Water resource management in the United States is evolving in the face of continuing challenges to protect water quality provide adequate quantities of water for competing uses and protect habitat and other natural resources In many jurisdictions and agencies this evolution is increasingly leading toward adoption of watershed management This approach is characterized by planning and decision making on a watershed scale integration of a variety of competing water resource priorities and goals cooperation of multiple stakeholders and governmental agencies and increased levels of public participation This report identifies the most promising watershed planning and management approaches from around the world evaluates how they operate their benefits and limitations and assesses the degree to which these approaches could be successfully adapted to the U S context Drawing on this international experience the report is intended to inform policy makers and practitioners and to promote the implementation of integrated watershed management approaches that are most likely to succeed This report Provides a decision making framework of watershed management efforts at all scales in the United States Evaluates past U S watershed management experience and identifies key characteristics for success as well as major challenges and opportunities for improving the watershed approach Summarizes and evaluates international case studies where innovative watershed management techniques have been used Identifies ten key lessons for sustainable water management including

the role of water wastewater utilities based on the experience of the international case study watersheds Identifying and Controlling Municipal Wastewater Odor Phase II Gregory M. Adams, Jay Witherspoon, 2004-03-01 This project was undertaken in response to needs by the wastewater treatment industry to better understand the generation of odors from biosolids produced by wastewater treatment plants WWTPs Its primary objective is to begin to establish relationships between WWTP process parameters and biosolids odors so that more effective techniques for minimizing biosolids odors can be developed The project consisted of a detailed field study involving extensive sampling and analyses at 11 WWTPs across North America with capacities from 13 to 350 million gallons per day mgd Biosolids samples were collected from the WWTPs at a number of sampling points which were chosen to represent a complete snapshot of biosolids generation and handling at each WWTP The sampling points started with influent wastewater proceeded through primary and secondary clarification and continued through digestion dewatering and onsite storage of dewatered biosolids cake Laboratory scale anaerobic storage tests were conducted to simulate odor development of biosolids in storage prior to their beneficial reuse or disposal A battery of analyses were performed on the biosolids samples by the participating utility laboratories commercial laboratories and specialized university laboratories The analytical data were evaluated and compared with process and operation parameters at each participating WWTP

Nature Based Solutions for Wastewater Treatment Katharine Cross,Katharina Tondera,Anacleto Rizzo,Lisa Andrews,Bernhard Pucher,Darja Istenič,Nathan Karres,Rob McDonald,2021-08-15 There are 2 4 billion people without improved sanitation and another 2 1 billion with inadequate sanitation i e wastewater drains directly into surface waters and despite improvements over the past decades the unsafe management of fecal waste and wastewater continues to present a major risk to public health and the environment UN 2016 There is growing interest in low cost sanitation solutions which harness natural systems However it can be difficult for wastewater utility managers to understand under what conditions such nature based solutions NBS might be applicable and how best to combine traditional infrastructure for example an activated sludge treatment plant with an NBS such as treatment wetlands There is increasing scientific evidence that treatment systems with designs inspired by nature are highly efficient treatment technologies The cost effective design and implementation of ecosystems in wastewater treatment is something that exists and has the potential to be further promoted globally as both a sustainable and practical solution This book serves as a compilation of technical references case examples and guidance for applying nature based solutions for treatment of domestic wastewater and enables a wide variety of stakeholders to understand the design parameters removal efficiencies costs co benefits for both people and nature and trade offs for consideration in their local context Examples through case studies are from across the globe and provide practical insights into the variety of potentially applicable solutions
