Seven Years to Save the PlanetAug 11 2023 For the first time in the history of the world one species has grown so numerous and so technologically powerful that it has the ability to destabilize the narrow range of temperature within which life can flourish. And we are now doing just that. Our generation is the guilty generation, but we will only just begin to feel the consequences of our actions, it is our children's and grandchildren's generations that will suffer. This book is a call to arms. We have time still to halt and reverse the process. Maybe 10 years, maybe less

- we have to throw our engines into reverse now in the battle to control our carbon emissions. Each one of us, acting collectively, can make a very real difference to the future of the world we live in. And we can do it very simply and easily. Bill McGuire tells us how.

Symphony in C: Carbon and the Evolution of (Almost) Everything Dec 23 2021 A Science News Favorite Book of 2019 An earth scientist reveals the dynamic biography of the most resonant—and most necessary—chemical element on Earth. Carbon. It's in the fibers in your hair, the timbers in your walls, the food that you eat, and the air that you breathe. It's worth billions of dollars as a luxury and half a trillion as a necessity, but there are still mysteries about the element that can be both diamond and coal. Where does it come from, what does it do, and why, above all, does life need it? With poetic storytelling, Robert M. Hazen leads us on a global journey through the origin and evolution of life's most essential and ubiquitous element.

Symphony in C Jan 04 2023 A Science News Favorite Book of 2019 An enchanting biography of the most resonant—and most necessary—chemical element on Earth. Carbon is everywhere: in the paper of this book and the blood of our bodies. It's with us from beginning to end, present in our baby clothes and coffin alike. We live on a carbon planet, and we are carbon life. No other element is so central to our well-being; yet, when missing or misaligned, carbon atoms can also bring about disease and even death. At once ubiquitous and mysterious, carbon holds the answers to some of humanity's biggest questions. Where did Earth come from? What will ultimately become of it—and of us? With poetic storytelling, earth scientist Robert M. Hazen explores the universe to discover the past, present, and future of life's most essential element. We're not only "made of star stuff," as Carl Sagan famously observed, but "Big Bang stuff," too. Hazen reveals that carbon's grand symphony began with a frenzied prelude shortly after the dawn of creation, bringing new attention to the tiny number of Big Bang-created carbon atoms that often get overlooked. In minutes, violently colliding protons and neutrons improbably formed the first carbon atoms, which can still be found within our bodies. His book then unfolds in four movements, building momentum as he explores carbon as the element of Earth, Air, Fire, and Water. He visits the famed volcanic crater Solfatara di Pozzuoli near Naples, where venting carbon dioxide and other noxious fumes condense into beautiful crystals. He climbs the cliffs of the

Scottish Highlands and delves deep into the precious-metal mines of Namibia, journeying toward Earth's mysterious core in search of undocumented carbon structures. Hazen often asks us to pause and consider carbon's role in climate change and what we can do about it, for our lives and this element are inextricably intertwined. With prose that sparkles like a diamond, *Symphony in C* tells the story of carbon, in which we all have a part.

The Ocean Carbon Cycle and Climate Apr 19 2024 Our desire to understand the global carbon cycle and its link to the climate system represents a huge challenge. These overarching questions have driven a great deal of scientific endeavour in recent years: What are the basic oceanic mechanisms which control the oceanic carbon reservoirs and the partitioning of carbon between ocean and atmosphere? How do these mechanisms depend on

the state of the climate system and how does the carbon cycle feed back on climate? What is the current rate at which fossil fuel carbon dioxide is absorbed by the oceans and how might this change in the future? To begin to answer these questions we must first understand the distribution of carbon in the ocean, its partitioning between different ocean reservoirs (the "solubility" and "biological" pumps of carbon), the mechanisms controlling these reservoirs, and the relationship of the significant physical and biological processes to the physical environment. The recent surveys from the JGOFS and WOCE (Joint Global Ocean Flux Study and World Ocean Circulation Experiment) programs have given us a first truly global survey of the physical and biogeochemical properties of the ocean. These new, high quality data provide the opportunity to better quantify the present oceans reservoirs of carbon and the changes due to fossil fuel burning. In addition, diverse process studies and time-series observations have clearly revealed the complexity of interactions between nutrient cycles, ecosystems, the carbon-cycle and the physical environment.

Economics of Carbon Sequestration in Forestry Mar 14 2021 Since the 1992 Earth Summit, there have been increased efforts on an international scale to address global climate change. Reducing the increased levels of CO₂ and other "greenhouse gases," which are believed to be contributing to this climatic change, will require major effort on the part of the world's governments. This means that the environmental, economic, social, and political

consequences of climate change must be understood, and that strategies to mitigate climate change must also address these issues. The workshop detailed in this book concentrated on how economic principles and analysis could contribute to the planning of forestry projects aimed at affecting terrestrial carbon balances. More than 30 international scientists came together for one week near Stockholm, Sweden and divided into working groups charged with addressing a specific issue and preparing a paper within this time frame. This book contains the majority of papers presented at this meeting, and includes both the working group papers and the individually presented papers.

The Carbon Cycle Dec 03 2022 Reducing carbon dioxide (CO₂) emissions is imperative to stabilizing our future climate. Our ability to reduce these emissions combined with an understanding of how much fossil-fuel-derived CO₂ the oceans and plants can absorb is central to mitigating climate change. In *The Carbon Cycle*, leading scientists examine how atmospheric carbon dioxide concentrations have changed in the past and how this may affect the concentrations in the future. They look at the carbon budget and the "missing sink" for carbon dioxide. They offer approaches to modeling the carbon cycle, providing mathematical tools for predicting future levels of carbon dioxide. This comprehensive text incorporates findings from the recent IPCC reports. New insights, and a convergence of ideas and views across several disciplines make this book an important contribution to the global change literature.

Embodied Carbon in Buildings Oct 21 2021 This book provides a single-source reference for whole life embodied impacts of buildings. The comprehensive and persuasive text, written by over 50 invited experts from across the world, offers an indispensable resource both to newcomers and to established practitioners in the field. Ultimately it provides a persuasive argument as to why embodied impacts are an essential aspect of sustainable built environments. The book is divided into four sections: measurement, including a strong emphasis on uncertainty analysis, as well as offering practical case studies of individual buildings and a comparison of materials; management, focusing in particular on the perspective of designers and contractors; mitigation, which identifies some specific design strategies as well as challenges; and finally global approaches, six chapters which describe in authoritative detail the ways in which the different regions of the world are tackling the issue.

Carbon Footprint Big Book Gr. 5-8 Feb 10 2021 Students will learn how they can improve the planet with our Carbon Footprint 3-book BUNDLE. Start engaging students in global climate change by personalizing their Own Carbon Footprint. Identify all the ways a kitchen uses energy. Calculate your travel footprint and learn ways to help reduce it. Next, bring climate change to the classroom by teaching students about their School's Carbon Footprint. Recognize the benefits of adding idle-free zones to your school. Find out how carbon offsets help reduce a school's carbon footprint. Finally, encourage students to make a difference on a larger scale by examining their Community's Carbon Footprint. Learn about the heat island effect caused by cities, and how this changes the local climate. Get inspired by reading about some green towns and cities all over the world. Each concept is paired with a carbon footprint calculator. Written to Bloom's Taxonomy and STEAM initiatives, additional graphic organizers, crossword, word search, comprehension quiz

and answer key are also included.

Global Warming: The Answer May 20 2024 "Global Warming: The Answer" takes as given that global warming is man-made and occurring with increasingly adverse effects. After a brief review of the carbon cycle (and how man is disturbing it), the book argues that global warming is an economic problem: Given the right prices, technical solutions will follow. After looking at the (limited) solutions for "personal virtue" in reducing pollution, the book examines the chimera of "a carbon neutral life-style," and necessity to achieve a fossil-free economy. Cap and Trade is shown to involve huge wealth transfers to established polluters, and is thus rejected in favor of a "revenue neutral, carbon tax." More specifically an initial carbon tax of \$250 ton, with the revenue returned the public through lowered payroll taxes in the U.S. (or V.A.T. or sales taxes elsewhere). Existing and pending technologies that will take-off once fossil fuels are taxed are reviewed, as are ancillary policies in support of the carbon tax. Some suggestions are offered for increasing international collaboration. It is emphasized however that to date no significant action has been take to combat global warming: Kyoto, higher mileage requirements, and An Inconvenient Truth notwithstanding. Action is urgent! But first the public have to understand the answer to global warming.

Marine Geochemistry Feb 22 2022 Marine geochemistry uses chemical elements and their isotopes to study how the ocean works in terms of ocean circulation, chemical composition, biological activity and atmospheric CO₂ regulation. This rapidly growing field is at a crossroad for many disciplines (physical, chemical and biological oceanography, geology, climatology, ecology, etc.). It provides important quantitative answers to questions such as: What is the deep ocean mixing rate? How much atmospheric CO₂ is pumped by the ocean? How fast are pollutants removed from the ocean? How do ecosystems react to anthropogenic pressure? This text gives a simple introduction to the concepts, the methods and the applications of marine geochemistry with a particular emphasis on isotopic tracers. Overall introducing a very large number of topics (physical oceanography, ocean chemistry, isotopes, gas exchange, modelling, biogeochemical cycles), with a balance of didactic and indepth information, it provides an outline and a complete course in marine geochemistry. Throughout, the book uses a hands-on approach with worked out exercises and problems (with answers provided at the end of the book), to help the students work through the concepts presented. A broad scale approach is take including ocean physics, marine biology, ocean-climate relations, remote sensing, pollutions and ecology, so that the reader acquires a global perspective of the ocean. It also includes new topics arising from ongoing research programs. This

textbook is essential reading for students, scholars, researchers and other professionals.

Reducing Your School's Carbon Footprint Gr. 5-8 Apr 14 2021 Bring climate change to the classroom by teaching students about their school's carbon footprint. Our resource helps students determine their school's carbon footprint and what they can do to make it smaller. Identify fossil fuels used at school and how they make your life more convenient. Brainstorm ways to reduce energy used in your school. Recognize the benefits of adding idle-free zones to your school. Explore events in the history of a slice of bread that caused the emission of greenhouse gases. Calculate the amount of carbon dioxide trees would remove from the atmosphere if they were planted around the perimeter of your school. Complete a project that will lead to a reduced school footprint. Find out how carbon offsets help reduce a school's carbon footprint. Written to Bloom's Taxonomy and STEAM initiatives, additional graphic organizers, carbon footprint calculator, crossword, word search, comprehension quiz and answer key are also included.

Climate Risk May 08 2023 Climate change is

fundamentally a risk management problem Climate Risk examines climate change as a risk management issue, detailing the problems inherent in that necessary but complex perspective. Written by a recognized risk management leader, this book details the impact of climate change on both the current economy, and the economy of future generations. Drawing on the insight of a team of Nobel Prize-winning economists, this informative book outlines the factors that make it difficult to price carbon emissions correctly, discusses the perspectives surrounding carbon emission taxation, and explores the probability of various climate change scenarios in the context of damages and valuation. Readers will find detailed arguments for why risk managers should already be taking climate change seriously, and delve into the economic analysis of this global problem. Pricing climate risk properly is key to making the economy work long-term while also being mindful of the potential tail risk and uncertainty that humans often ignore. People are not very good at making rational decisions about rare outcomes, raising the concern of an overreaction when society finally does react to the risk of climate catastrophe and begins to price it. This book explores the critical question of how much climate risk insurance to buy – that is, where to price carbon dioxide emissions. Examine climate change as a risk management problem Delve into the issues surrounding carbon emission pricing Consider appropriate tax levels for emissions Learn how the future economy will be impacted by climate change Damages

from climate change won't hit the economy for a while, and the potential for a low-probability/high-damage scenario is so uncertain that it is only recently being discussed academically. Risk managers must be prepared for what's to come, and Climate Risk begins the conversation with some of the best minds in the industry.

Wetland Carbon and Environmental Management Mar 26 2022 Explores how the management of wetlands can influence carbon storage and fluxes. Wetlands are vital natural assets, including their ability to take-up atmospheric carbon and restrict subsequent carbon loss to facilitate long-term storage. They can be deliberately managed to provide a natural solution to mitigate climate change, as well as to help offset direct losses of wetlands from various land-use changes and natural drivers.

Wetland Carbon and Environmental Management presents a collection of wetland research studies from around the world to demonstrate how environmental management can improve carbon sequestration while enhancing wetland health and function. Volume highlights include: Overview of carbon storage in the landscape Introduction to wetland management practices Comparisons of natural, managed, and converted wetlands Impact of wetland management on carbon storage or loss Techniques for scientific assessment of wetland carbon processes Case studies

Zero and Low Carbon Solutions for the Energy Sector
proposes mature (high technology readiness level) net-
zero and low carbon pathways and technologies in the
energy sector, discussing net-/near-zero solutions for
producing and storing power, heat, biofuel, and hydrogen,
and highlighting various pathways and processes to
achieve net-zero targets and address climate concerns.
Each chapter provides a relevant case study to aid in the
practical application of concepts, covering
decarbonization solutions that have high potential to be
used in the near future, such as solar-hybrid systems for
net-zero power generation, CCUS-hybrid systems for low
carbon power generation, pumped hydropower for power
storage, commercial concentrating solar power plants for
heat generation, gasification with CCUS for biofuel
production, hybrid thermochemical process for hydrogen
production, and more. Written from the perspective of
firsthand research experience in the field, this book
includes information on: Net-zero power generation via

solar, wind, hydropower, geothermal, hydrogen, and marine processes
Near-zero power generation via nuclear, coal, natural gas, biomass, and ammonia processes
Mechanical and battery-based power storage and heat storage via physical and thermochemical processes
Near-zero heat generation processes and biofuels production, including biogas, biomethane, bioethanol, and biodiesel
Hydrogen production via electrolysis and thermochemical processes with CCUS and low-emission technologies for hydrogen storage
Net-Zero and Low Carbon Solutions for the Energy Sector is a valuable resource for business professionals, academics, and policy makers who are active in contributing to net-zero emissions targets for keeping the atmospheric CO₂ levels in an acceptable range.

Introduction to Climate Change Management Oct 13 2023
This book provides climate students with the basic scientific background to climate change management. Students will learn about international and national approaches to climate change management defined in voluntary initiatives as well as in national law and international agreements. The book describes mitigation and adaptation measures, monitoring and reporting of greenhouse gas emissions, and strategies for achieving a low-carbon economy, including green finance. This book combines theory and practice, introducing students to the conceptual background but also taking a professional and

technical approach with case studies and low carbon toolkits. Filled with didactic elements such as concept schemes, tables, charts, figures, examples, as well as questions and answers at the end of the chapters, this book aims to engage critical thinking and the discussion of important topics of our days. The low-carbon strategy is one of the answers to limiting the greenhouse effect on our planet. This strategy is to minimize the overall carbon consumption in the life cycle of the products we consume, from the extraction of raw materials to the end of their life. The future is being built today. This book will guide its readers along the path of imagining and realizing a low-carbon economy."
