Lowering of the boiling curve of biodiesel by metathesis Jürgen Bünger, Peter Eilts, Axel Munack, Jürgen Krahl, 2014-01-21 The boiling line of diesel fuels is relevant for the combustion in modern engines. Biodiesel shows a boiling behavior that is very different to diesel fuel. To adapt the boiling line, metathesis reactions were carried out. Different products were obtained by varying the catalysts and the ratio of biodiesel to 1 hexene. As 20% blends in diesel fuel, some metathesis products were quite similar to the diesel fuel boiling line. The metathesis fuels were tested regarding interactions with other fuel components and engine oil. Additionally, the material compatibility was in focus. Corrosion effects on copper were within the specification for diesel fuel. Exhaust gas emissions from 20% blends as well as mutagenicity showed no significant deviations versus diesel fuel. In the result, no significant disadvantages for metathesis fuels were found. However, their production occurs currently only in lab scale.

The second edition is organized into six parts, providing a structured journey through every aspect of diesel engines and emissions control. Part I: A foundational exploration of the diesel engine combustion and essential subsystems. Part II: An in-depth look at emission characterization, health and environmental impacts, testing methods, and global regulations. Part III: A comprehensive overview of diesel fuels, covering petroleum, diesel, alternative fuels, and engine lubricants. Part IV: An exploration of engine efficiency and emission control technologies, from exhaust gas recirculation to engine control. Part V: The latest developments in diesel exhaust aftertreatment, encompassing catalyst technologies and particulate filters. Part VI: A
