

Organic Molecules Worksheet: Review

Read through each section and answer the following questions

Organic molecules are the molecules which exist in all living things. They are life's building blocks. All things are formed from these organic molecules. There are four categories of organic molecules: Carbohydrates, lipids, proteins and nucleic acids.

1. How are organic molecules related to all living things?

2. Name four categories of organic molecules which form the basis of all living things:

a. _____ b. _____ c. _____ d. _____

Organic molecules have four common characteristics. First, they are all carbon based, meaning they all contain carbon. They are formed from just a few elements which join together to form small molecules which join together, or bond, to form large molecules. The third characteristic of all organic molecules is that each kind of organic molecule is built from a single type of building block. For example, the building block of carbohydrates is sugar, the building block of lipids is fatty acids, the building block of protein is amino acids and the building block of nucleic acids is the nucleotide. When these building blocks are joined together, they form a large molecule (polymer), just as bricks joined together form a wall. For example, sugars join together form a carbohydrate.

3. All of the organic molecules are based on which element? _____

4. Many times, the molecules join to form long chains with what kind of backbone?

5. How are the building blocks of organic molecules like bricks?

6. What is the building block of each of the four classes of organic molecules?

a. The building blocks of carbohydrates are _____

b. The building blocks of lipids are _____

c. The building blocks of proteins are _____

d. The building blocks of nucleic acids are _____

7. What is a polymer? _____

The last common characteristic of all organic molecules is that their form determines their function. That means that their shape determines how they will behave and how they will react with other molecules. For example, the order of amino acids in a protein will determine the shape and function of the protein just as the order of words in a sentence shapes the meaning of the sentence.

8. What determines how organic molecules will look and behave?

Tables of Spectral Data for Structure Determination of Organic Compounds Ernő Pretsch, T. Clerc, J. Seibl, W. Simon, 2013-06-29 Although numerical data are in principle universal the compilations presented in this book are extensively annotated and interleaved with text This translation of the second German edition has been prepared to facilitate the use of this work with all its valuable detail by the large community of English speaking scientists Translation has also provided an opportunity to correct and revise the text and to update the nomenclature Fortunately spectroscopic data and their relationship with structure do not change much with time so one can predict that this book will for a long period of time continue to be very useful to organic chemists involved in the identification of organic compounds or the elucidation of their structure Klaus Biemann Cambridge MA April 1983 Preface to the First German Edition Making use of the information provided by various spectroscopic techniques has become a matter of routine for the analytically oriented organic chemist Those who have graduated recently received extensive training in these techniques as part of the curriculum while their older colleagues learned to use these methods by necessity One can therefore assume that chemists are well versed in the proper choice of the methods suitable for the solution of a particular problem and to translate the experimental data into structural information
