DNA Science David A. Micklos, Greg A. Freyer, 2003 This is the second edition of a highly successful textbook, over 50,000 copies sold in which a highly illustrated narrative text is combined with easy-to-use, thoroughly reliable laboratory protocols. It contains a fully up-to-date collection of 12 rigorously tested and reliable lab experiments in molecular biology developed at the internationally renowned Dolan DNA Learning Center of Cold Spring Harbor Laboratory, which culminate in the construction and cloning of a recombinant DNA molecule. Proven through more than 10 years of teaching at research and nonresearch colleges and universities, junior colleges, community colleges, and advanced biology programs in high school, this book has been successfully integrated into introductory biology, general biology, genetics, microbiology, cell biology, molecular genetics, and molecular biology courses. The first eight chapters have been completely revised, extensively rewritten, and updated. The new coverage extends to the completion of the draft sequence of the human genome and the enormous impact these and other sequence data are having on medicine, research, and our view of human evolution. All sections on the concepts and techniques of molecular biology have been updated to reflect the current state of laboratory research. The laboratory experiments cover basic techniques of gene isolation and analysis, honed by over 10 years of classroom use to be thoroughly reliable even in the hands of teachers and students with no prior experience. Extensive prelab notes at the beginning of each experiment explain how to schedule and prepare, while flow charts and icons make the protocols easy to follow. As in the first edition of this book, the laboratory course is completely supported by quality-assured products from the Carolina Biological Supply Company, from bulk reagents to useable reagent systems to single-use kits, thus satisfying a broad range of teaching applications.

Approaches in Bioremediation Ram Prasad, Elisabet Aranda, 2018-12-08 Bioremediation refers to the clean up of pollution in soil groundwater surface water and air using typically microbiological processes It uses naturally occurring bacteria and fungi or plants to degrade transform or detoxify hazardous substances to human health or the environment For bioremediation to be effective microorganisms must enzymatically attack the pollutants and convert them to harmless products As bioremediation can be effective only where environmental conditions permit microbial growth and action its application often involves the management of ecological factors to allow microbial growth and degradation to continue at a faster rate Like other technologies bioremediation has its limitations Some contaminants such as chlorinated organic or high aromatic hydrocarbons are resistant to microbial attack They are degraded either gradually or not at all hence it is not easy to envisage the rates of clean up for bioremediation implementation Bioremediation represents a field of great expansion due to the important development of new technologies Among them several decades on metagenomics expansion has led to the detection of autochthonous microbiota that plays a key role during transformation Transcriptomic guides us to know the expression of key genes and proteomics allow the characterization of proteins that conduct specific reactions In this book we show specific technologies applied in bioremediation of main interest for research in the field with special attention on fungi which have been poorly studied microorganisms Finally new approaches in the field such as CRISPR CAS9 are also discussed Lastly it introduces management strategies such as bioremediation application for managing affected environment and bioremediation approaches Examples of successful bioremediation applications are illustrated in radionuclide entrapment and retardation soil stabilization and remediation of polycyclic aromatic hydrocarbons phenols plastics or fluorinated compounds Other emerging bioremediation methods include electro bioremediation microbe aided phytoremediation genetic recombinant technologies in enhancing plants in accumulation of inorganic metals and metalloids as well as degradation of organic pollutants protein metabolic engineering to increase bioremediation efficiency including nanotechnology applications are also discussed
