This book covers multifaceted aspects of sustainable energy solutions for remote areas in the tropics, particularly focusing on Southeast Asia. With insights from both the academic world and real-life implementation, readers will gain an overview of the range of energy problems currently facing the remote tropics, and what potential solutions are available. The book provides a detailed overview of various energy needs in the Southeast Asian tropics, a region where a significant portion of the population still lives without access to electricity. It not only addresses technical solutions to the energy problems but also tackles the social and wider implications, offering readers a more holistic understanding of the potential held by renewable energy. The chapters are structured to present first an overview of the problem at hand, and then a description of the

technologies that could potentially solve it. Applications of the technologies; business models that are now available or being developed; the impact of the technologies; and future, more sustainable solutions are all discussed. Given its in-depth analysis, the book will be of interest to energy professionals in the tropics, energy policymakers, and students studying sustainable energy. This volume contains the proceedings of FM2003, the 12th International Formal Methods Europe Symposium which was held in Pisa, Italy on September 8–14, 2003. Formal Methods Europe (FME, [www.fmeurope.org](http://www.fmeurope.org)) is an independent association which aims to stimulate the use of and research on formal methods for system development. FME conferences began with a VDM Europe symposium in 1987. Since then, the meetings have grown and have been held about once every 18 months. Throughout the years the symposia have been notably successful in bringing together researchers, tool developers, vendors, and users, both from academia and from industry. Unlike previous symposia in the series, FM 2003 was not given a specific theme. Rather, its main goal could be synthesized as “widening the scope.” Indeed, the organizers aimed at enlarging the audience and impact of the symposium along several directions. Dropping the suffix ‘E’ from the title of the conference reflects the wish to welcome participation and contribution from every country; also, contributions from outside the traditional Formal Methods community were solicited. The recent innovation of including an Industrial Day as an important part of the symposium shows the strong commitment to involve industrial people more and more within the Formal Methods community. Even the traditional and rather fuzzy borderline between “software engineering formal methods” and methods and formalisms exploited in different fields of engineering was somewhat challenged. This comprehensive and acclaimed volume provides a wealth of practical information on the design, installation, and operation of air conditioning, heating, and ventilating systems. Consumer Electronics is the first book of its kind, and comprehensively covers the theory, applications and maintenance of various audio/video systems, telecommunication systems and electronic home/office appliances. The book completely covers the Aaron Jebin and Anderson Jerin, both holding Bachelors of Technology degree, in Mechanical Engineering. Both have vast experience in the field of Heating Ventilation and Air Conditioning. Aaron has worked on multiple design projects for various HVAC installations. Anderson is working as a design engineer in a leading boiler plant in India. The authors have put in extensive research to make sure this book is up to the latest standards. However, we are always open to receive constructive criticism, for the improvement of any future work, or for our personal growth. The aim of this book is to provide basic knowledge about Refrigeration and Air-Conditioner to various people. This is possible because of the vast research the authors have done before starting this work. This volume, SGIoT 2020, constitutes the refereed proceedings of the 4th EAI International Conference on Smart Grid and Internet of Things, SGIoT 2020, held in TaiChung, Taiwan, in December 2020. The IoT-driven smart grid is currently a hot area of research boosted by the global need to improve electricity access, economic growth of emerging countries, and the worldwide power plant capacity additions. The 40 papers presented were reviewed and selected from 159 submissions and present broad range of topics in wireless sensor, vehicular ad hoc networks, security, blockchain, and deep learning. This book develops a new system of modeling and simulations based on intelligence system. As we are directly moving from Third Industrial Revolution (IR3.0) to Fourth Industrial Revolution (IR4.0), there are many emergence techniques and algorithm that appear in many sciences and engineering branches. Nowadays, most industries are using IR4.0 in their product development as well as to refine their products. These include simulation on oil rig drilling, big data analytics on consumer analytics, fastest algorithm for large-scale numerical simulations and many more. These will save millions of dollar in the operating costs. Without any doubt, mathematics, statistics and computing are well blended to form an intelligent system for simulation and modeling.

Motivated by this rapid development, in this book, a total of 41 chapters are contributed by the respective experts. The main scope of the book is to develop a new system of modeling and simulations based on machine learning, neural networks, efficient numerical algorithm and statistical methods. This book is highly suitable for postgraduate students, researchers as well as scientists that have interest in intelligent numerical modeling and simulations.
