**Legged Robots that Balance** Marc H. Raibert, 1986 This book by a leading authority on legged locomotion presents exciting engineering and science along with fascinating implications for theories of human motor control It lays fundamental groundwork in legged locomotion one of the least developed areas of robotics addressing the possibility of building useful legged robots that run and balance The book describes the study of physical machines that run and balance on just one leg including analysis computer simulation and laboratory experiments Contrary to expectations it reveals that control of such machines is not particularly difficult It describes how the principles of locomotion discovered with one leg can be extended to systems with several legs and reports preliminary experiments with a quadruped machine that runs using these principles Raibert's work is unique in its emphasis on dynamics and active balance aspects of the problem that have played a minor role in most previous work His studies focus on the central issues of balance and dynamic control while avoiding several problems that have dominated previous research on legged machines Marc Raibert is Associate Professor of Computer Science and Robotics at Carnegie Mellon University and on the editorial board of The MIT Press journal Robotics Research Legged Robots That Balance is fifteenth in the Artificial Intelligence Series edited by Patrick Winston and Michael Brady

Dynamic Stabilisation of the Biped Lucy Powered by Actuators with Controllable Stiffness Bram Vanderborght, 2010-09-07 This book reports on the developments of the bipedal walking robot Lucy Special about it is that the biped is not actuated with the classical electrical drives but with pleated pneumatic artificial muscles In an antagonistic setup of such muscles both the torque and the compliance are controllable From human walking there is evidence that joint compliance plays an important role in energy efficient walking and running Moreover pneumatic artificial muscles have a high power to weight ratio and can be coupled directly without complex gearing mechanism which can be beneficial towards legged mechanisms Additionally they have the capability of absorbing impact shocks and store and release motion energy This book gives a complete description of Lucy the hardware the electronics and the software A hybrid simulation program combining the robot dynamics and muscle valve thermodynamics has been written to evaluate control strategies before implementing them in the real biped

**Stability Optimization of Open Loop Controlled Walking Robots** Katja D. Mombaur, 2002

*Fast Motions in Biomechanics and Robotics* Moritz Diehl, Katja Mombaur, 2007-07-13 In the past decades much progress has been made in the field of walking robots The current state of technology makes it possible to create humanoid robots that nearly walk like a human being climb stairs or avoid small stacles However the dream of a robot running as fast and as elegantly as a human is still far from becoming reality Control of such fast motions is still a big technological issue in robotics and the maximum running speed of contemporary robots is still much smaller than that of human track runners The conventional control approach that most of these robots are based on does not seem to be suitable to increase the running speeds up to a biological level In order to address this challenge we invited an interdisciplinary community of researchers from robotics biomechanics control engineering and applied mathematics to come together in Heidelberg at the Symposium Fast Motions in Biomechanics and Robotics Optimization Feedback Control which was held at the International Science Forum IWH on September 7 9 2005 The number of participants in this symposium was kept small in order to promote discussions and enable a fruitful exchange of ideas
